# Closest Pair Problem

- Given a set of points find the pair of points  $p, q$  that minimizes  $\text{dist}(p, q)$

# Divide and conquer

- If we solve the problem on two subsets, does it help? (Separate by median x coordinate)

# Packing Lemma

Suppose that the minimum distance between points is at least  $\delta$ , what is the maximum number of points that can be packed in a ball of radius  $\delta$ ?

# Combining Solutions

- Suppose the minimum separation from the sub problems is  $\delta$
- In looking for cross set closest pairs, we only need to consider points with  $\delta$  of the boundary
- How many cross border interactions do we need to test?

A packing lemma bounds the number of distances to check

# Details

- Preprocessing: sort points by  $y$
- Merge step
  - Select points in boundary zone
  - For each point in the boundary
    - Find highest point on the other side that is at most  $\delta$  above
    - Find lowest point on the other side that is at most  $\delta$  below
    - Compare with the points in this interval (there are at most 6)

Identify the pairs of points that are compared in the merge step following the recursive calls

# Algorithm run time

- After preprocessing:
  - $T(n) = cn + 2 T(n/2)$

# Integer Arithmetic

```

---

Runtime for standard algorithm to multiply two n digit numbers:

# Recursive Algorithm (First attempt)

$$x = x_1 2^{n/2} + x_0$$

$$y = y_1 2^{n/2} + y_0$$

$$\begin{aligned} xy &= (x_1 2^{n/2} + x_0) (y_1 2^{n/2} + y_0) \\ &= x_1 y_1 2^n + (x_1 y_0 + x_0 y_1) 2^{n/2} + x_0 y_0 \end{aligned}$$

Recurrence:

Run time:

# Simple algebra

$$x = x_1 2^{n/2} + x_0$$

$$y = y_1 2^{n/2} + y_0$$

$$xy = x_1 y_1 2^n + (x_1 y_0 + x_0 y_1) 2^{n/2} + x_0 y_0$$

$$p = (x_1 + x_0)(y_1 + y_0) = x_1 y_1 + x_1 y_0 + x_0 y_1 + x_0 y_0$$

# Karatsuba's Algorithm

Multiply  $n$ -digit integers  $x$  and  $y$

Let  $x = x_1 2^{n/2} + x_0$  and  $y = y_1 2^{n/2} + y_0$

Recursively compute

$$a = x_1 y_1$$

$$b = x_0 y_0$$

$$p = (x_1 + x_0)(y_1 + y_0)$$

Return  $a2^n + (p - a - b)2^{n/2} + b$

Recurrence:  $T(n) = 3T(n/2) + cn$
