Richard Anderson Lecture 26 NP-Completeness

Complexity Classes

- P: Class of problems that can be solved in polynomial time
- NP: Class of problems that can be solved in non-deterministic polynomial time
 - Corresponds to problems where we can verify a solution in polynomial time

Polynomial time reductions

- Y is Polynomial Time Reducible to X
 - Solve problem Y with a polynomial number of computation steps and a polynomial number of calls to a black box that solves X
 - Notations: $Y <_P X$

Lemmas

 Suppose Y <_P X. If X can be solved in polynomial time, then Y can be solved in polynomial time.

 Suppose Y <_P X. If Y cannot be solved in polynomial time, then X cannot be solved in polynomial time.

NP-Completeness

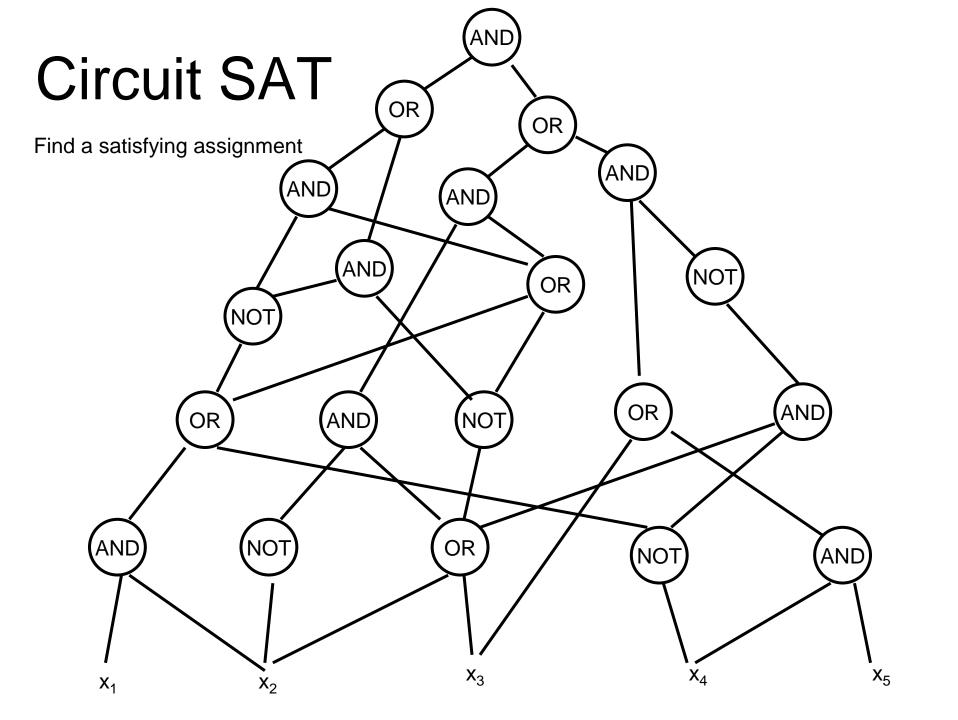

- A problem X is NP-complete if
 - X is in NP
 - For every Y in NP, $Y <_P X$

X is a "hardest" problem in NP

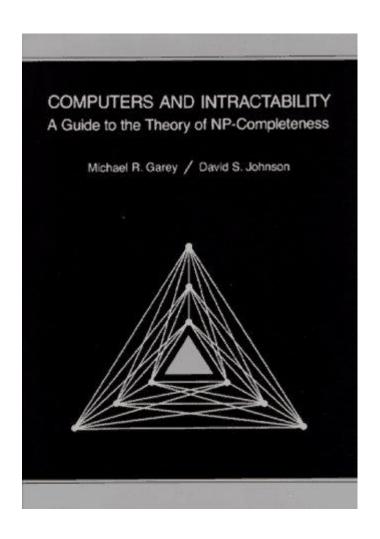

- If X is NP-Complete, Z is in NP and X <_P Z
 - Then Z is NP-Complete

Cook's Theorem

 The Circuit Satisfiability Problem is NP-Complete

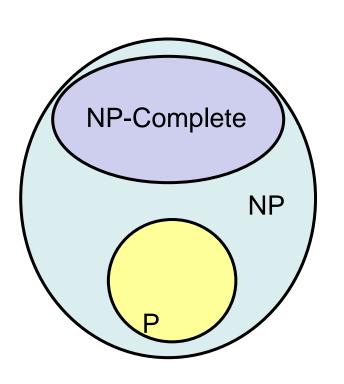

Garey and Johnson

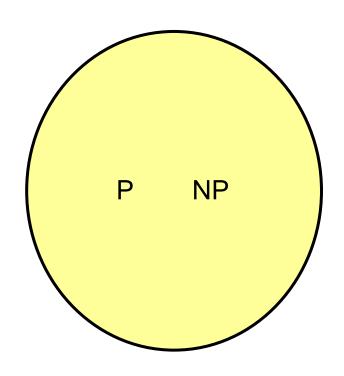

History

 - Independent discovery of NP-Completeness in USSR

P vs. NP Question

Populating the NP-Completeness

Universe

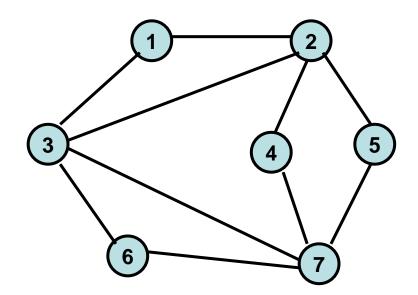

NP-Complete

NP

- Circuit Sat <_P 3-SAT
- 3-SAT <_P Independent Set
- 3-SAT <_P Vertex Cover
- Independent Set <_P Clique
- 3-SAT <_P Hamiltonian Circuit
- Hamiltonian Circuit <_P Traveling Salesman
- 3-SAT <_P Integer Linear Programming
- 3-SAT <_P Graph Coloring
- 3-SAT <_P Subset Sum
- Subset Sum <_P Scheduling with Release times and deadlines

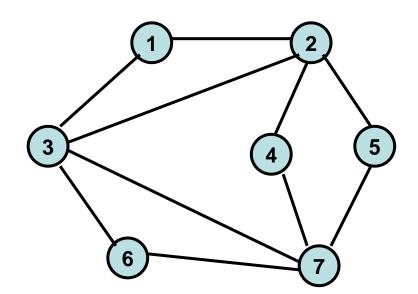

Sample Problems

- Independent Set
 - Graph G = (V, E), a subset S of the vertices is independent if there are no edges between vertices in S

Vertex Cover

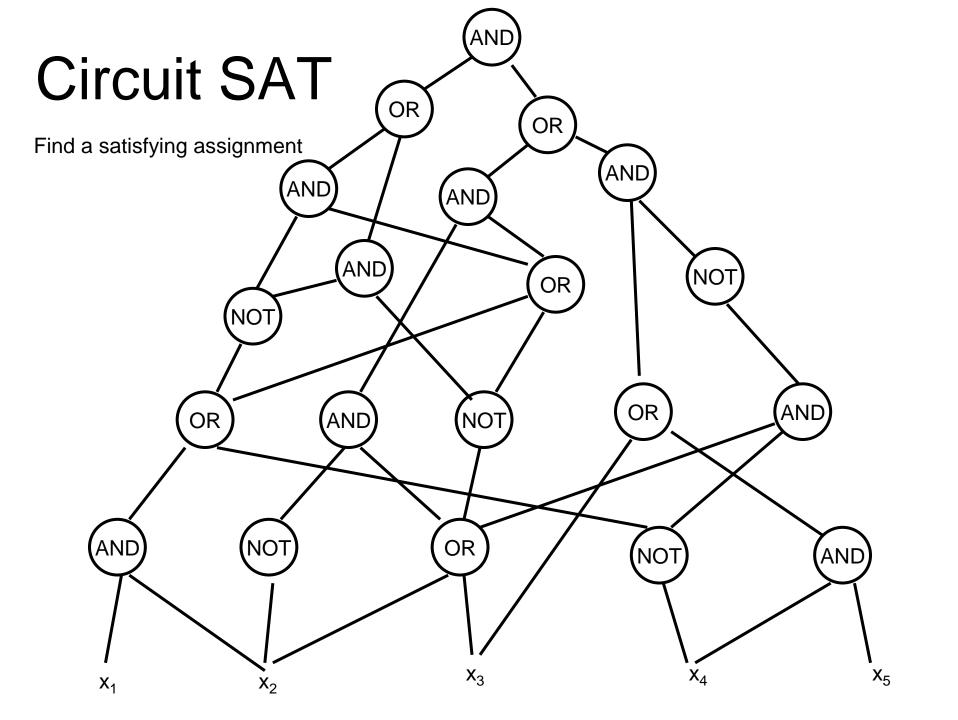

- Vertex Cover
 - Graph G = (V, E), a subset S of the vertices is a vertex cover if every edge in E has at least one endpoint in S

Cook's Theorem

 The Circuit Satisfiability Problem is NP-Complete

- Circuit Satisfiability
 - Given a boolean circuit, determine if there is an assignment of boolean values to the input to make the output true

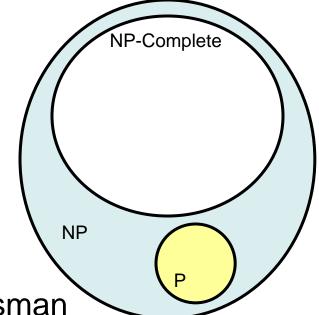

Proof of Cook's Theorem

- Reduce an arbitrary problem Y in NP to X
- Let A be a non-deterministic polynomial time algorithm for Y
- Convert A to a circuit, so that Y is a Yes instance iff and only if the circuit is satisfiable

Populating the NP-Completeness

Universe

- 3-SAT <_P Integer Linear Programming
- 3-SAT <_P Graph Coloring
- 3-SAT <_P Subset Sum
- Subset Sum <_P Scheduling with Release times and deadlines

Satisfiability

Literal: A Boolean variable or its negation.

$$x_i$$
 or $\overline{x_i}$

Clause: A disjunction of literals.

$$C_j = x_1 \vee \overline{x_2} \vee x_3$$

Conjunctive normal form: A propositional formula Φ that is the conjunction of clauses.

$$\Phi = C_1 \wedge C_2 \wedge C_3 \wedge C_4$$

SAT: Given CNF formula Φ , does it have a satisfying truth assignment?

3-SAT: SAT where each clause contains exactly 3 literals.

Ex:
$$(\overline{x_1} \lor x_2 \lor x_3) \land (x_1 \lor \overline{x_2} \lor x_3) \land (x_2 \lor x_3) \land (\overline{x_1} \lor \overline{x_2} \lor \overline{x_3})$$

Yes: $x_1 = \text{true}, x_2 = \text{true } x_3 = \text{false}.$

3-SAT is NP-Complete

Theorem. 3-SAT is NP-complete.

Pf. Suffices to show that CIRCUIT-SAT \leq_P 3-SAT since 3-SAT is in NP.

- Let K be any circuit.
- Create a 3-SAT variable x_i for each circuit element i.
- Make circuit compute correct values at each node:

•
$$x_2 = \neg x_3$$
 \Rightarrow add 2 clauses: $x_2 \lor x_3$, $x_2 \lor x_3$

•
$$x_1 = x_4 \lor x_5 \Rightarrow \text{ add 3 clauses:} \quad x_1 \lor \overline{x_4}, \ x_1 \lor \overline{x_5}, \ \overline{x_1} \lor x_4 \lor x_5$$

•
$$x_0 = x_1 \wedge x_2 \implies \text{add 3 clauses:} \quad \frac{}{x_0} \vee x_1, \quad \frac{}{x_0} \vee x_2, \quad x_0 \vee x_1 \vee x_2$$

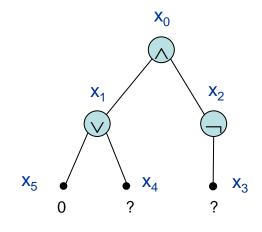

Hard-coded input values and output value.

•
$$x_5 = 0 \implies \text{add 1 clause: } \overline{x_5}$$

•
$$x_0 = 1 \implies \text{add 1 clause: } x_0$$

Final step: turn clauses of length < 3 into clauses of length exactly 3.

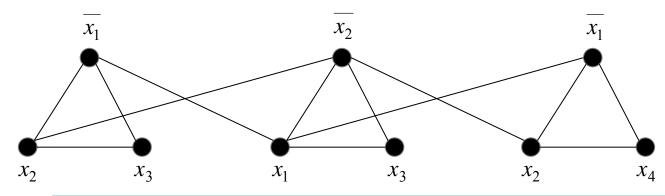

3 Satisfiability Reduces to Independent Set

Claim. $3-SAT \le P$ INDEPENDENT-SET.

Pf. Given an instance Φ of 3-SAT, we construct an instance (G, k) of INDEPENDENT-SET that has an independent set of size k iff Φ is satisfiable.

Construction.

- G contains 3 vertices for each clause, one for each literal.
- Connect 3 literals in a clause in a triangle.
- Connect literal to each of its negations.

$$\mathsf{k} = 3 \qquad \Phi = \left(\overline{x_1} \vee x_2 \vee x_3\right) \wedge \left(x_1 \vee \overline{x_2} \vee x_3\right) \wedge \left(\overline{x_1} \vee x_2 \vee x_4\right)$$

G

3 Satisfiability Reduces to Independent Set

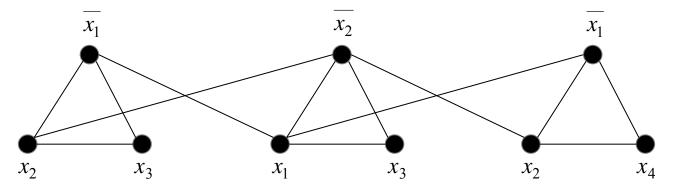

Claim. G contains independent set of size $k = |\Phi|$ iff Φ is satisfiable.

Pf. \Rightarrow Let S be independent set of size k.

- S must contain exactly one vertex in each triangle.
- Set these literals to true. and any other variables in a consistent way
- Truth assignment is consistent and all clauses are satisfied.

Pf
Given satisfying assignment, select one true literal from each triangle. This is an independent set of size k. •

G

$$= 3 \qquad \Phi = \left(\overline{x_1} \vee x_2 \vee x_3\right) \wedge \left(x_1 \vee \overline{x_2} \vee x_3\right) \wedge \left(\overline{x_1} \vee x_2 \vee x_4\right)$$

$$k = 3$$

IS <_P VC

Lemma: A set S is independent iff V-S is a vertex cover

 To reduce IS to VC, we show that we can determine if a graph has an independent set of size K by testing for a Vertex cover of size n - K

IS <_P VC

Find a maximum independent set S

3 4 5

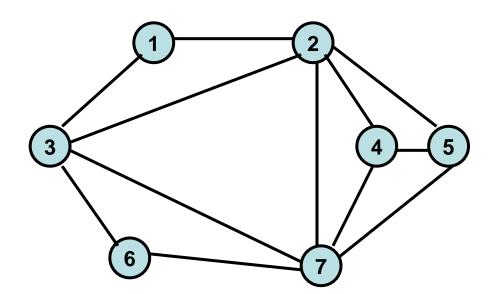

Show that V-S is a vertex cover

Clique

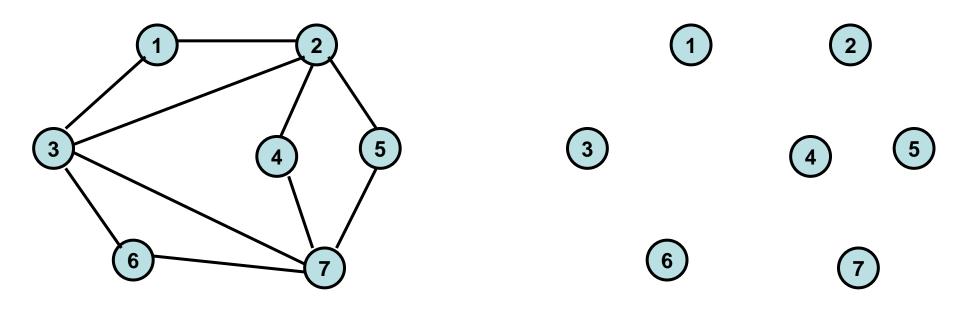

Clique

 Graph G = (V, E), a subset S of the vertices is a clique if there is an edge between every pair of vertices in S

Complement of a Graph

 Defn: G'=(V,E') is the complement of G=(V,E) if (u,v) is in E' iff (u,v) is not in E

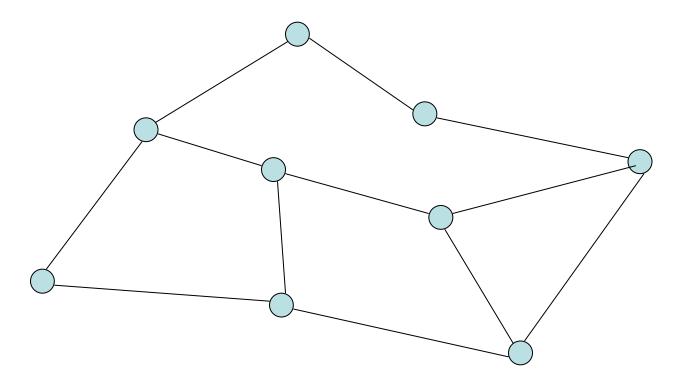

IS <_P Clique

 Lemma: S is Independent in G iff S is a Clique in the complement of G

 To reduce IS to Clique, we compute the complement of the graph. The complement has a clique of size K iff the original graph has an independent set of size K

Hamiltonian Circuit Problem

 Hamiltonian Circuit – a simple cycle including all the vertices of the graph

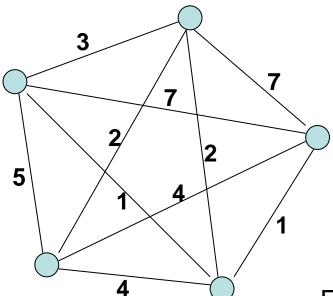

Thm: Hamiltonian Circuit is NP Complete

Reduction from 3-SAT

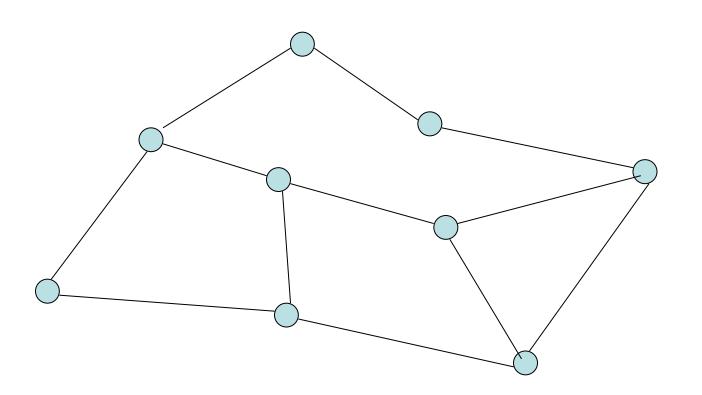

Traveling Salesman Problem

 Given a complete graph with edge weights, determine the shortest tour that includes all of the vertices (visit each vertex exactly once, and get back to the starting point)

Find the minimum cost tour

Thm: $HC <_P TSP$

Graph Coloring

- NP-Complete
 - Graph K-coloring
 - Graph 3-coloring

- Polynomial
 - Graph 2-Coloring
