

# CSE 421

# Algorithms

Richard Anderson

Autumn 2016

Lecture 1

# CSE 421 Course Introduction

- CSE 421, Introduction to Algorithms
  - MWF, 1:30-2:20 pm
  - MGH 241
- Instructor
  - Richard Anderson, [anderson@cs.washington.edu](mailto:anderson@cs.washington.edu)
  - Office hours:
    - CSE 582
    - Office hours: Monday 2:30-3:30, Wednesday 2:30-3:30
- Teaching Assistants
  - Deepali Aneja
  - Maxwell Horton
  - Benjamin Jones

# Announcements

- It's on the web.
- Homework due Wednesdays
  - HW 1, Due October 5, 2015
  - It's on the web (or will be soon)
- You should be on the course mailing list
  - But it will probably go to your uw.edu account

# Text book

- Algorithm Design
- Jon Kleinberg, Eva Tardos
- Read Chapters 1 & 2
- Expected coverage:
  - Chapter 1 through 7
- Book available at:
  - UW Bookstore (\$163.50)
  - Ebay (\$25.30)
  - Amazon (\$19.79 and up)
  - Kindle (\$104.99)
  - PDF

# Course Mechanics

- Homework
  - Due Wednesdays
  - About 5 problems, sometimes programming
  - Target: 1 week turnaround on grading
- Exams (In class)
  - Midterm, Monday, October 31 (probably)
  - Final, Monday, December 12, 2:30-4:20 pm
- **Approximate** grade weighting
  - HW: 50, MT: 15, Final: 35
- Course web
  - Slides, Handouts

All of Computer Science is the  
Study of Algorithms

# How to study algorithms

- Zoology
- Mine is faster than yours is
- Algorithmic ideas
  - Where algorithms apply
  - What makes an algorithm work
  - Algorithmic thinking

# Introductory Problem: Stable Matching

- Setting:
  - Assign TAs to Instructors
  - Avoid having TAs and Instructors wanting changes
    - E.g., Prof A. would rather have student X than her current TA, and student X would rather work for Prof A. than his current instructor.

# Formal notions

- Perfect matching
- Ranked preference lists
- Stability

# Example (1 of 3)

$m_1: w_1 w_2$

$m_2: w_2 w_1$

$w_1: m_1 m_2$

$w_2: m_2 m_1$

$m_1 \circ$

$\circ w_1$

$m_2 \circ$

$\circ w_2$

# Example (2 of 3)

$m_1: w_1 w_2$

$m_1 \circ$

$\circ w_1$

$m_2: w_1 w_2$

$w_1: m_1 m_2$

$w_2: m_1 m_2$

$m_2 \circ$

$\circ w_2$

# Example (3 of 3)

$m_1: w_1 w_2$

$m_1 \circ$

$\circ w_1$

$m_2: w_2 w_1$

$w_1: m_2 m_1$

$w_2: m_1 m_2$

$m_2 \circ$

$\circ w_2$

# Formal Problem

- Input
  - Preference lists for  $m_1, m_2, \dots, m_n$
  - Preference lists for  $w_1, w_2, \dots, w_n$
- Output
  - Perfect matching  $M$  satisfying stability property:

If  $(m', w') \in M$  and  $(m'', w'') \in M$  then  
( $m'$  prefers  $w'$  to  $w''$ ) or ( $w''$  prefers  $m''$  to  $m'$ )

# Idea for an Algorithm

m proposes to w

If w is unmatched, w accepts

If w is matched to  $m_2$

If w prefers m to  $m_2$  w accepts m, dumping  $m_2$

If w prefers  $m_2$  to m, w rejects m

Unmatched m proposes to the highest w on its preference list **that it has not already proposed to**

# Algorithm

Initially all  $m$  in  $M$  and  $w$  in  $W$  are free

While there is a free  $m$

$w$  highest on  $m$ 's list that  $m$  has not proposed to

    if  $w$  is free, then match  $(m, w)$

    else

        suppose  $(m_2, w)$  is matched

        if  $w$  prefers  $m$  to  $m_2$

            unmatch  $(m_2, w)$

            match  $(m, w)$

# Example

$m_1: w_1 w_2 w_3$

$m_2: w_1 w_3 w_2$

$m_3: w_1 w_2 w_3$

$w_1: m_2 m_3 m_1$

$w_2: m_3 m_1 m_2$

$w_3: m_3 m_1 m_2$

$m_1 \circ$

$\circ w_1$

$m_2 \circ$

$\circ w_2$

$m_3 \circ$

$\circ w_3$

# Does this work?

- Does it terminate?
- Is the result a stable matching?
- Begin by identifying invariants and measures of progress
  - $m$ 's proposals get worse (have higher  $m$ -rank)
  - Once  $w$  is matched,  $w$  stays matched
  - $w$ 's partners get better (have lower  $w$ -rank)

Claim: If an  $m$  reaches the end of its list, then all the  $w$ 's are matched

Claim: The algorithm stops in at most  $n^2$  steps

When the algorithm halts, every  $w$   
is matched

Why?

Hence, the algorithm finds a perfect  
matching

# The resulting matching is stable

Suppose

$(m_1, w_1) \in M, (m_2, w_2) \in M$

$m_1$  prefers  $w_2$  to  $w_1$

How could this happen?

# Result

- Simple,  $O(n^2)$  algorithm to compute a stable matching
- Corollary
  - A stable matching always exists
