

CSE 421: Introduction to Algorithms

Stable Matching

Paul Beame

Matching Residents to Hospitals

- **Goal:** Given a set of preferences among hospitals and medical school residents (graduating medical students), design a **self-reinforcing** admissions process.
- **Unstable pair:** applicant **x** and hospital **y** are **unstable** if:
 - **x** prefers **y** to their assigned hospital.
 - **y** prefers **x** to one of its admitted residents.
- **Stable assignment.** Assignment with no unstable pairs.
 - Natural and desirable condition.
 - Individual self-interest will prevent any applicant/hospital side deal from being made.

Simpler: Stable Matching Problem

- **Goal.** Given n hetero men and n hetero women, find a "suitable" matching.
 - Participants rate members of opposite sex.
 - Each man lists women in order of preference from best to worst.
 - Each woman lists men in order of preference from best to worst.

Women's Preference Profile

Stable Matching Problem

- **Perfect matching:** everyone is matched monogamously.
 - Each man gets exactly one woman.
 - Each woman gets exactly one man.
- **Stability:** no incentive for some pair of participants to undermine assignment by joint action.
 - In matching **M**, an unmatched pair **m-w** is **unstable** if man **m** and woman **w** prefer each other to current partners.
 - Unstable pair **m-w** could each improve by eloping.
- **Stable matching:** perfect matching with no unstable pairs.
- **Stable matching problem.** Given the preference lists of **n** men and **n** women, find a stable matching if one exists.

Stable Matching Problem

- Q. Is assignment $X-C$, $Y-B$, $Z-A$ stable?

Stable Roommate Problem

- **Q.** Do stable matchings always exist?
- **A.** Not obvious a priori.
- **Stable roommate problem.**
 - $2n$ people; each person ranks others from **1** to $2n-1$.
 - Assign roommate pairs so that no unstable pairs.

	<i>1st</i>	<i>2nd</i>	<i>3rd</i>
<i>Adam</i>	B	C	D
<i>Bob</i>	C	A	D
<i>Chris</i>	A	B	D
<i>David</i>	A	B	C

A-B, C-D \Rightarrow B-C unstable
A-C, B-D \Rightarrow A-B unstable
A-D, B-C \Rightarrow A-C unstable

- **Observation.** Stable matchings do not always exist for stable roommate problem.

Propose-And-Reject Algorithm

- **Propose-and-reject algorithm.** [Gale-Shapley 1962]
Intuitive method that guarantees to find a stable matching.

Initialize each person to be **free**.

```
while (some man is free and hasn't proposed to every woman) {  
    Choose such a man m  
    w = 1st woman on m's list to whom m has not yet proposed  
    if (w is free)  
        assign m and w to be engaged  
    else if (w prefers m to her fiancé m')  
        assign m and w to be engaged, and m' to be free  
    else  
        w rejects m  
}
```

Proof of Correctness: Termination

- **Observation 1.** Men propose to women in decreasing order of preference.
- **Observation 2.** Once a woman is matched, she never becomes unmatched; she only "trades up."
- **Claim.** Algorithm terminates after at most n^2 iterations of while loop.
- **Proof.** Each time through the while loop a man proposes to a new woman. There are only n^2 possible proposals. ■

Brenda	X	Y	Z	V	W
Claire	Y	Z	V	W	X
Diane	Z	V	W	X	Y
Erika	V	W	X	Y	Z

$n(n-1) + 1$ proposals required

Proof of Correctness: Perfection

- **Claim.** All men and women get matched.
- **Proof. (by contradiction)**
 - Suppose, for sake of contradiction, that **Zoran** is not matched upon termination of algorithm.
 - Then some woman, say **Amy**, is not matched upon termination.
 - By Observation 2 (only trading up, never becoming unmatched), **Amy** was never proposed to.
 - But, **Zoran** proposes to everyone, since he ends up unmatched. ■

Proof of Correctness: Stability

- **Claim.** No unstable pairs.
- **Proof.** (by contradiction)
 - Suppose **A-Z** is an unstable pair: each prefers each other to partner in Gale-Shapley matching **S***.
 - **Case 1:** **Z** never proposed to **A**.
 - ⇒ **Z** prefers his GS partner to **A**.
 - ⇒ **A-Z** is stable.
 - **Case 2:** **Z** proposed to **A**.
 - ⇒ **A** rejected **Z** (right away or later)
 - ⇒ **A** prefers her GS partner to **Z**.
 - ⇒ **A-Z** is stable.
 - In either case **A-Z** is stable, a contradiction. ■

men propose in decreasing order of preference

...

women only trade up

Summary

- **Stable matching problem.** Given n men and n women, and their preferences, find a stable matching if one exists.
- **Gale-Shapley algorithm.** Guarantees to find a stable matching for **any** problem instance.
- **Q.** How to implement GS algorithm efficiently?
- **Q.** If there are multiple stable matchings, which one does GS find?

Implementation for Stable Matching Algorithms

- Problem size
 - $N=2n^2$ words
 - $2n$ people each with a preference list of length n
 - $2n^2 \log n$ bits
 - specifying an ordering for each preference list takes $n \log n$ bits
- Brute force algorithm
 - Try all $n!$ possible matchings
 - Do any of them work?
- Gale-Shapley Algorithm
 - n^2 iterations, each costing constant time as follows:

Efficient Implementation

- **Efficient implementation.** We describe $O(n^2)$ time implementation.
- **Representing men and women.**
 - Assume men are named $1, \dots, n$.
 - Assume women are named $1', \dots, n'$.
- **Engagements.**
 - Maintain a list of free men, e.g., in a queue.
 - Maintain two arrays `wife[m]`, and `husband[w]`.
 - set entry to 0 if unmatched
 - if m matched to w then `wife[m]=w` and `husband[w]=m`
- **Men proposing.**
 - For each man, maintain a list of women, ordered by preference.
 - Maintain an array `count[m]` that counts the number of proposals made by man m .

Efficient Implementation

- **Women rejecting/accepting.**
 - Does woman **w** prefer man **m** to man **m'**?
 - For each woman, create **inverse** of preference list of men.
 - Constant time access for each query after **O(n)** preprocessing per woman. **O(n²)** total reprocessing cost.

Amy	1 st	2 nd	3 rd	4 th	5 th	6 th	7 th	8 th
Pref	8	3	7	1	4	5	6	2

Amy	1	2	3	4	5	6	7	8
Inverse	4 th	8 th	2 nd	5 th	6 th	7 th	3 rd	1 st

```
for i = 1 to n
  inverse[pref[i]] = i
```

Amy prefers man **3** to **6**
since **inverse[3]=2 < 7=inverse[6]**

Understanding the Solution

- **Q.** For a given problem instance, there may be several stable matchings. Do all executions of Gale-Shapley yield the same stable matching? If so, which one?

	1st	2nd	3rd
Xavier	A	B	C
Yuri	B	A	C
Zoran	A	B	C

	1st	2nd	3rd
Amy	Y	X	Z
Brenda	X	Y	Z
Claire	X	Y	Z

- An instance with two stable matchings.
 - A-X, B-Y, C-Z.
 - A-Y, B-X, C-Z.

Understanding the Solution

- **Q.** For a given problem instance, there may be several stable matchings. Do all executions of Gale-Shapley yield the same stable matching? If so, which one?
- **Def.** Man m is a **valid partner** of woman w if there exists some stable matching in which they are matched.
- **Man-optimal assignment.** Each man receives **best** valid partner (according to his preferences).
- **Claim.** All executions of GS yield a **man-optimal** assignment, which is a stable matching!
 - No reason a priori to believe that man-optimal assignment is perfect, let alone stable.
 - Simultaneously best for each and every man.

Man Optimality

- **Claim.** GS matching S^* is man-optimal.
- **Proof.** (by contradiction)
 - Suppose some man is paired with someone other than his best partner. Men propose in decreasing order of preference \Rightarrow some man is rejected by a valid partner.
 - Let Y be the man who is the **first** such rejection, and let A be the women who is **first** valid partner that rejects him.
 - Let S be a stable matching where A and Y are matched.
 - In building S^* , when Y is rejected, A forms (or reaffirms) engagement with a man, say Z , whom she prefers to Y .
 - Let B be Z 's partner in S .
 - In building S^* , Z is not rejected by any valid partner at the point when Y is rejected by A .
 - Thus, Z prefers A to B .
 - But A prefers Z to Y .
 - Thus $A-Z$ is unstable in S . ■

since this is the **first** rejection by a valid partner

Stable Matching Summary

- **Stable matching problem.** Given preference profiles of n men and n women, find a **stable** matching.

no man and woman prefer to be with each other than with their assigned partner

- **Gale-Shapley algorithm.** Finds a stable matching in $O(n^2)$ time.

- **Man-optimality.** In version of GS where men propose, each man receives best valid partner.

w is a valid partner of m if there exist some stable matching where m and w are paired

- **Q.** Does man-optimality come at the expense of the women?

Woman Pessimality

- **Woman-pessimal assignment.** Each woman receives worst valid partner.
- **Claim.** GS finds **woman-pessimal** stable matching S^* .
- **Proof.**
 - Suppose $A-Z$ matched in S^* , but Z is not worst valid partner for A .
 - There exists stable matching S in which A is paired with a man, say Y , whom she likes less than Z .
 - Let B be Z 's partner in S .
 - Z prefers A to B . ← **man-optimality of S^***
 - Thus, $A-Z$ is an unstable in S . ■

Extensions: Matching Residents to Hospitals

- **Ex:** Men \approx hospitals, Women \approx med school residents.
- **Variant 1.** Some participants declare others as unacceptable.
- **Variant 2.** Unequal number of men and women. e.g. resident **A** unwilling to work in Cleveland
- **Variant 3.** Limited polygamy. e.g. hospital **X** wants to hire **3** residents
- **Def.** Matching **S** is **unstable** if there is a hospital **h** and resident **r** such that:
 - **h** and **r** are acceptable to each other; and
 - either **r** is unmatched, or **r** prefers **h** to her assigned hospital; and
 - either **h** does not have all its places filled, or **h** prefers **r** to at least one of its assigned residents.

Application: Matching Residents to Hospitals

- **NRMP.** (National Resident Matching Program)
 - Original use just after WWII. ← predates computer usage
 - Ides of March, 23,000+ residents.
- **Rural hospital dilemma.**
 - Certain hospitals (mainly in rural areas) were unpopular and declared unacceptable by many residents.
 - Rural hospitals were under-subscribed in NRMP matching.
 - How can we find stable matching that benefits "rural hospitals"?
- **Rural Hospital Theorem.** Rural hospitals get exactly same residents in every stable matching!
- **Note:** Pre-1995 NRMP favored hospitals (they proposed). Changed in 1995 to favor residents.

Lessons Learned

- Powerful ideas learned in course.
 - Isolate underlying structure of problem.
 - Create useful and efficient algorithms.
- Potentially deep social ramifications.
[legal disclaimer]

Deceit: Machiavelli Meets Gale-Shapley

- **Q.** Can there be an incentive to misrepresent your preference profile?
 - Assume you know men's propose-and-reject algorithm will be run.
 - Assume that you know the preference profiles of all other participants.
- **Fact.** No, for any man. Yes, for some women. No mechanism can guarantee a stable matching and be cheatproof.
