CSE 421

NP-Completeness / Linear Programs

Yin Tat Lee
Fixing some mistake.

**Thm.** Max cardinality matching in $G = \text{value of max flow in } H$.

**Proof.** (matching val $\geq$ maxflow val) Let $f$ be a max flow in $H$ of value $k$. Integrality theorem $\Rightarrow k$ is integral and we can assume $f$ is 0-1.

Consider $M = \text{set of edges from } X \text{ to } Y \text{ with } f(e) = 1$.

- each node in $X$ and $Y$ participates in at most one edge in $M$.
- $|M| = k$ because the flow from $s \cup X$ to $Y \cup t$ equals to the flow value $k$. 
A decision problem is a computational problem where the answer is just yes/no.

We can define a problem by a set $X$. The answer for the input $s$ is YES iff $s \in X$.

**Certifier:** Algorithm $C(x, t)$ is a certifier for problem $A$ if $s \in X$ if and only if (There is a $t$ such that $C(x, t) = YES$)

**NP:** Set of all decision problems for which there exists a poly-time certifier.

**Co-NP:** $X \in NP$ if and only if $\overline{X} \in co-NP$. 
NP Completeness

**Complexity Theorists Approach:** We don’t know how to prove any problem in NP is hard. So, let’s find *hardest* problems in NP.

**NP-hard:** A problem $B$ is NP-hard iff for any problem $A \in NP$, we have $A \leq_p B$

**NP-Completeness:** A problem $B$ is NP-complete iff $B$ is NP-hard and $B \in NP$.

**Motivations:**
- If $P \neq NP$, then every NP-Complete problems is not in P. So, we shouldn’t try to design Polytime algorithms
- To show $P = NP$, it is enough to design a polynomial time algorithm for just one NP-complete problem.
Cook-Levin Theorem

Theorem (Cook 71, Levin 73): 3-SAT is NP-complete, i.e., for all problems $A \in \text{NP}$, $A \leq_p 3\text{-SAT}$.

(See CSE 431 for the proof)

• So, 3-SAT is the hardest problem in NP.

What does this say about other problems of interest? Like Independent set, Vertex Cover, …

Fact: If $A \leq_p B$ and $B \leq_p C$ then, $A \leq_p C$

Pf idea: Just compose the reductions from $A$ to $B$ and $B$ to $C$

So, if we prove $3\text{-SAT} \leq_p$ Independent set, then Independent Set, Clique, Vertex cover, Set cover are all NP-complete

$$3\text{-SAT} \leq_p \text{Independent Set} \leq_p \text{Vertex Cover} \leq_p \text{Set Cover}$$
3-SAT $\leq_p$ Independent Set

Map a 3-CNF to $(G,k)$. Say $k$ is number of clauses

- Create a vertex for each literal
- Joint two literals if
  - They belong to the same clause (blue edges)
  - The literals are negations, e.g., $x_i, \overline{x}_i$ (red edges)
- Set $k$ be the # of clauses.

$$
(x_1 \lor \overline{x}_3 \lor x_4) \land (x_2 \lor \overline{x}_4 \lor x_3) \land (x_2 \lor \overline{x}_1 \lor x_3)
$$

![Diagram](image-url)
Correctness of 3-SAT $\leq_p$ Indep Set

F satisfiable $\Rightarrow$ An independent of size k
Given a satisfying assignment, Choose one node from each clause where the literal is satisfied

$$(x_1 \lor \overline{x_3} \lor x_4) \land (x_2 \lor \overline{x_4} \lor x_3) \land (x_2 \lor \overline{x_1} \lor x_3)$$

Satisfying assignment: $x_1 = T, x_2 = F, x_3 = T, x_4 = F$

- S has exactly one node per clause $\Rightarrow$ No blue edges between S
- S follows a truth-assignment $\Rightarrow$ No red edges between S
- S has one node per clause $\Rightarrow |S| = k$
Correctness of \(3\text{-SAT} \leq_p \text{Indep Set}\)

An independent set of size \(k\) \(\implies\) A satisfying assignment
Given an independent set \(S\) of size \(k\).
\(S\) has exactly one vertex per clause (because of blue edges)
\(S\) does not have \(x_i, \overline{x}_i\) (because of red edges)
So, \(S\) gives a satisfying assignment

\[
\begin{align*}
   x_1 &= F, \ x_2 =?, \ x_3 = T, \ x_4 = T \\
   \overline{x}_1 \\ 
   x_2 \\ 
   \overline{x}_3 \\ 
   x_3 \\ 
   \overline{x}_4 \\ 
   x_4
\end{align*}
\]

Satisfying assignment: \(x_1 = F, x_2 =?, x_3 = T, x_4 = T\)
\((x_1 \lor \overline{x}_3 \lor x_4) \land (x_2 \lor \overline{x}_4 \lor x_3) \land (x_2 \lor \overline{x}_1 \lor x_3)\)
Summary

• If a problem is NP-hard it does not mean that all instances are hard, e.g., Vertex-cover has a polynomial-time algorithm in trees

• We learned the crucial idea of polynomial-time reduction. This can be even used in algorithm design, e.g., we know how to solve max-flow so we reduce image segmentation to max-flow

• NP-Complete problems are the hardest problem in NP

• NP-hard problems may not necessarily belong to NP.

• Polynomial-time reductions are transitive relations
Linear Programming
Linear System of Equations

In high school we learn Gaussian elimination algorithm to solve a system of linear equations

\[
\begin{align*}
    x_1 + x_3 &= 7 \\
    2x_2 + x_1 &= 5 \\
    3x_1 + 7x_2 - x_3 &= 1
\end{align*}
\]

We set \( x_3 = 7 - x_1 \) and we substitute in the following equations.

Then we substitute \( x_2 = \frac{5 - x_1}{2} \) in to the third equations. The third equational uniquely defines \( x_1 \).
Optimize a linear function subject to linear inequalities

\[ \text{max } 3x_1 + 4x_3 \]
\[ \text{s. t., } x_1 + x_2 \leq 5 \]
\[ x_3 - x_1 = 4 \]
\[ x_3 - x_2 \geq -5 \]
\[ x_1, x_2, x_3 \geq 0 \]

• We can have inequalities,
• We can have a linear objective functions
Applications of Linear Programming

Generalizes: $Ax=b$, 2-person zero-sum games, shortest path, max-flow, matching, multicommodity flow, MST, min weighted arborescence, ...

Why significant?
• We can solve linear programming in polynomial time.
• We can model many practical problems with a linear model and solve it with linear programming

Linear Programming in Practice:
• There are very fast implementations: CPLEX, Gorubi, ....
• CPLEX can solve LPs with millions of variables/constraints in seconds
Example 1: Diet Problem

Suppose you want to schedule a diet for yourself. There are four category of food: veggies, meat, fruits, and dairy. Each category has its own (p)rice, (c)alories and (h)appiness per pound:

<table>
<thead>
<tr>
<th></th>
<th>veggies</th>
<th>meat</th>
<th>fruits</th>
<th>dairy</th>
</tr>
</thead>
<tbody>
<tr>
<td>price</td>
<td>$p_v$</td>
<td>$p_m$</td>
<td>$p_f$</td>
<td>$p_d$</td>
</tr>
<tr>
<td>calorie</td>
<td>$c_v$</td>
<td>$c_m$</td>
<td>$c_f$</td>
<td>$c_d$</td>
</tr>
<tr>
<td>happiness</td>
<td>$h_v$</td>
<td>$h_m$</td>
<td>$h_f$</td>
<td>$h_d$</td>
</tr>
</tbody>
</table>

Linear Modeling: Consider a linear model: If we eat 0.5lb of meat an 0.2lb of fruits we will be $0.5\ h_m + 0.2\ h_f$ happy

• You should eat 1500 calories to be healthy
• You can spend 20 dollars a day on food.

Goal: Maximize happiness?
Diet Problem by LP

- You should eat 1500 calories to be healthy
- You can spend 20 dollars a day on food.

**Goal:** Maximize happiness?

<table>
<thead>
<tr>
<th></th>
<th>veggies</th>
<th>meat</th>
<th>fruits</th>
<th>dairy</th>
</tr>
</thead>
<tbody>
<tr>
<td>price</td>
<td>$p_v$</td>
<td>$p_m$</td>
<td>$p_f$</td>
<td>$p_d$</td>
</tr>
<tr>
<td>calorie</td>
<td>$c_v$</td>
<td>$c_m$</td>
<td>$c_f$</td>
<td>$c_d$</td>
</tr>
<tr>
<td>happiness</td>
<td>$h_v$</td>
<td>$h_m$</td>
<td>$h_f$</td>
<td>$h_d$</td>
</tr>
</tbody>
</table>

\[
\text{max } x_v h_v + x_m h_m + x_f h_f + x_d h_d \\
\text{s.t. } x_v p_v + x_m p_m + x_f p_f + x_d p_d \leq 20 \\
\text{ } x_v c_v + x_m c_m + x_f c_f + x_d c_d \leq 1500 \\
\text{ } x_v, x_m, x_f, x_d \geq 0
\]

#pounds of veggies, meat, fruits, dairy to eat per day
How to Design an LP?

• Define the set of variables

• Put constraints on your variables,
  • should they be nonnegative?

• Write down the constraints
  • If a constraint is not linear try to approximate it with a linear constraint

• Write down the objective function
  • If it is not linear approximation with a linear function

• Decide if it is a minimize/maximization problem
Example 2: Max Flow

Define the set of variables
• For every edge $e$ let $x_e$ be the flow on the edge $e$

Put constraints on your variables
• $x_e \geq 0$ for all edge $e$ (The flow is nonnegative)

Write down the constraints
• $x_e \leq c(e)$ for every edge $e$, (Capacity constraints)
• $\sum_{e \text{ out of } v} x_e = \sum_{e \text{ in to } v} x_e \ \forall v \neq s, t$ (Conservation constraints)

Write down the objective function
• $\sum_{e \text{ out of } s} x_e$

Decide if it is a minimize/maximization problem
• max
Example 2: Max Flow

\[
\begin{align*}
\text{max} & \quad \sum_{e \text{ out of } s} x_e \\
\text{s.t.} & \quad \sum_{e \text{ out of } v} x_e = \sum_{e \text{ in to } v} x_e \quad \forall v \neq s, t \\
& \quad x_e \leq c(e) \quad \forall e \\
& \quad x_e \geq 0 \quad \forall e
\end{align*}
\]
Example 3: Min Cost Max Flow

Suppose we can route 100 gallons of water from $s$ to $t$. But for every pipe edge $e$ we have to pay $p(e)$ for each gallon of water that we send through $e$.

Goal: Send 100 gallons of water from $s$ to $t$ with minimum possible cost

$$\min \sum_{e \in E} p(e) \cdot x_e$$

s.t. 
$$\sum_{e \text{ out of } v} x_e = \sum_{e \text{ in to } v} x_e \quad \forall v \neq s, t$$
$$\sum_{e \text{ out of } s} x_e = 100$$
$$x_e \leq c(e) \quad \forall e$$
$$x_e \geq 0 \quad \forall e$$
Example 4: Metabolic Network

Let $v_i$ are the rate of different chemical reaction in your body. It satisfies mass conversation (translate to linear inequality). It satisfies some upper and lower bound. Optimizing certain function in your body is corresponding to solving a linear program!

How you find that LP? DNA!

https://vmh.uni.lu/#reconmap

Disclaimer: I suspect your biology is better than mine.
Summary (Linear Programming)

• Linear programming is one of the biggest advances in 20th century

• It is being used in many areas of science: Mechanics, Physics, Operations Research, and in CS: AI, Machine Learning, Theory, …

• Almost all problems that we talked can be solved with LPs, Why not use LPs?
  • In some sense, current fastest algorithm for maxflow is based on LP!
  • Maybe one day, I need to rewrite CSE 421.
  • But still need to wait for a test of time.

• There is rich theory of LP-duality which generalizes max-flow min-cut theorem

Up to now, the current asymptotically fastest algorithm is by me. Feel free to beat it.
What is next?

• CSE 431 (Complexity Course)
  • How to prove lower bounds on algorithms?

• CSE 521 (Graduate Algorithms Course)
  • How to design streaming algorithms?
  • How to design algorithms for high dimensional data?
  • How to use matrices/eigenvalues/eigenvectors to design algorithms
  • How to use LPs to design algorithms?

• CSE 525 (Graduate Randomized Algorithms Course)
  • How to use randomization to design algorithms?
  • How to use Markov Chains to design algorithms?

• CSE ??? (Graduate Convex Optimization)
  • A new course by me next winter 😊
