# **CSE 421 Algorithms**

Richard Anderson Lecture 14, Autumn 2019 Divide and Conquer

# $T(n) = aT(n/b) + n^c$

- Balanced: a = bc  $-T(n) = 4T(n/2) + n^2$
- Increasing: a > b<sup>c</sup>
  - -T(n) = 9T(n/8) + n
  - $-T(n) = 3T(n/4) + n^{1/2}$
- Decreasing: a < b<sup>c</sup>
  - -T(n) = 5T(n/8) + n
  - $-T(n) = 7T(n/2) + n^3$

#### What you really need to know about recurrences

- · Work per level changes geometrically with
- Geometrically increasing (x > 1)
  - The bottom level wins
- Geometrically decreasing (x < 1)
  - The top level wins
- Balanced (x = 1)
  - Equal contribution

#### Divide and Conquer Algorithms

- Split into sub problems
- Recursively solve the problem
- Combine solutions
- Make progress in the split and combine stages
  - Quicksort progress made at the split step
- Mergesort progress made at the combine step
- D&C Algorithms
  - Strassen's Algorithm Matrix Multiplication
  - Inversions
  - Median
  - Closest Pair
  - Integer MultiplicationFFT

# How to multiply 2 x 2 matrices with 7 multiplications

Where: Multiply 2 x 2 Matrices: |r s| |a b| |e g|  $p_1 = (b - d)(f + h)$ |t u| = |c d| |f h| $p_2 = (a + d)(e + h)$  $p_3 = (a - c)(e + g)$  $r = p_1 + p_2 - p_4 + p_6$  $p_4 = (a + b)h$  $s = p_4 + p_5$  $p_5 = a(g - h)$  $t = p_6 + p_7$  $p_6 = d(f - e)$  $p_7 = (c + d)e$  $u = p_2 - p_3 + p_5 - p_7$ 

Aho, Hopcroft, Ullman 1974

# Strassen's Algorithms

- Treat n x n matrices as 2 x 2 matrices of n/2 x n/2 submatrices
- Use Strassen's trick to multiply 2 x 2 matrices with 7 multiplies
- Base case standard multiplication for single
- Recurrence:  $T(n) = 7 T(n/2) + cn^2$
- Solution is  $O(7^{\log n}) = O(n^{\log 7})$  which is about O(n<sup>2.807</sup>)

#### Inversion Problem

- Let a<sub>1</sub>, . . . a<sub>n</sub> be a permutation of 1 . . n
- (a<sub>i</sub>, a<sub>i</sub>) is an inversion if i < j and a<sub>i</sub> > a<sub>i</sub>

4, 6, 1, 7, 3, 2, 5

- Problem: given a permutation, count the number of inversions
- This can be done easily in O(n2) time
  - Can we do better?

### **Application**

- Counting inversions can be use to measure how close ranked preferences are
  - People rank 20 movies, based on their rankings you cluster people who like that same type of movie

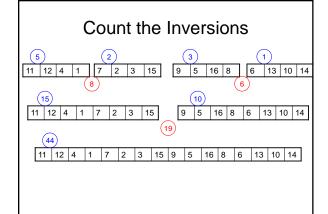

### **Counting Inversions**

11 12 4 1 7 2 3 15 9 5 16 8 6 13 10 14

Count inversions on lower half

Count inversions on upper half

Count the inversions between the halves

Problem – how do we count inversions between sub problems in O(n) time?

• Solution – Count inversions while merging

1 2 3 4 7 11 12 15 5 6 8 9 10 13 14 16

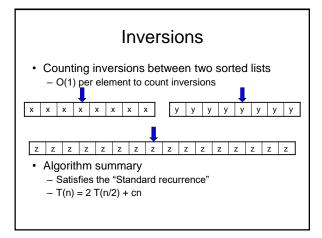

Standard merge algorithm – add to inversion count when an element is moved from the upper array to the solution

Use the merge algorithm to count inversions

1 4 11 12 2 3 7 15

5 8 9 16 6 10 13 14

Indicate the number of inversions for each element detected when merging

# Computing the Median

- Given n numbers, find the number of rank n/2
- · One approach is sorting
  - Sort the elements, and choose the middle one
  - Can you do better?

# Problem generalization

 Selection, given n numbers and an integer k, find the k-th largest

```
Select(A, k) \{ \\ Choose element x from A \\ S_1 = \{y \text{ in } A \mid y < x\} \\ S_2 = \{y \text{ in } A \mid y < x\} \\ S_3 = \{y \text{ in } A \mid y > x\} \\ \text{if } (|S_2| > |k|) \\ \text{return Select}(S_2, k) \\ \text{else if } (|S_2| + |S_3| > |k|) \\ \text{return } x \\ \text{else} \\ \\ \text{return Select}(S_1, k - |S_2| - |S_3|) \\ \}
```

#### Randomized Selection

- · Choose the element at random
- Analysis can show that the algorithm has expected run time O(n)

#### **Deterministic Selection**

• What is the run time of select if we can guarantee that choose finds an x such that  $|S_1| < 3n/4$  and  $|S_2| < 3n/4$  in O(n) time

# BFPRT Algorithm

• A very clever choose algorithm . . .

Split into n/5 sets of size 5 M be the set of medians of these sets Let x be the median of M

### BFPRT runtime

 $|S_1| < 3n/4, |S_2| < 3n/4$ 

Split into n/5 sets of size 5 M be the set of medians of these sets x be the median of M Construct  $\rm S_1$  and  $\rm S_2$  Recursive call in  $\rm S_1$  or  $\rm S_2$ 

#### **BFPRT** Recurrence

•  $T(n) \le T(3n/4) + T(n/5) + c n$ 

Prove that T(n) <= 20 c n
