

## CSE 421 Algorithms

Richard Anderson  
Lecture 18, Autumn 2019  
Dynamic Programming

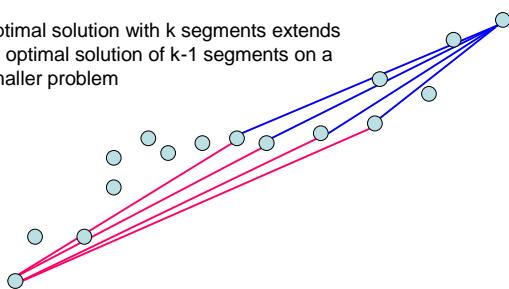

### Optimal linear interpolation

Optimal linear interpolation with K segments

$$\text{Opt}_k[j] = \min_i \{ \text{Opt}_{k-1}[i] + E_{i,j} \} \text{ for } 0 < i < j$$

Optimal solution with k segments extends an optimal solution of k-1 segments on a smaller problem

### Subset Sum Problem

- Let  $w_1, \dots, w_n = \{6, 8, 9, 11, 13, 16, 18, 24\}$
- Find a subset that has as large a sum as possible, without exceeding 50

### Adding a variable for Weight

- Opt[ j, K ] the largest subset of  $\{w_1, \dots, w_j\}$  that sums to at most K
  - {2, 4, 7, 10}
  - Opt[2, 7] =
  - Opt[3, 7] =
  - Opt[3, 12] =
  - Opt[4, 12] =

### Subset Sum Recurrence

- Opt[ j, K ] the largest subset of  $\{w_1, \dots, w_j\}$  that sums to at most K

## Subset Sum Grid

$$\text{Opt}[j, K] = \max(\text{Opt}[j - 1, K], \text{Opt}[j - 1, K - w_j] + v_j)$$

{2, 4, 7, 10}

## Subset Sum Code

```
for j = 1 to n
    for k = 1 to W
        Opt[j, k] = max(Opt[j-1, k], Opt[j-1, k-w_j] + v_j)
```

## Knapsack Problem

- Items have weights and values
- The problem is to maximize total value subject to a bound on weight
- Items {I<sub>1</sub>, I<sub>2</sub>, ..., I<sub>n</sub>}

  - Weights {w<sub>1</sub>, w<sub>2</sub>, ..., w<sub>n</sub>}
  - Values {v<sub>1</sub>, v<sub>2</sub>, ..., v<sub>n</sub>}
  - Bound K

- Find set S of indices to:
  - Maximize  $\sum_{i \in S} v_i$  such that  $\sum_{i \in S} w_i \leq K$

## Knapsack Recurrence

Subset Sum Recurrence:

$$\text{Opt}[j, K] = \max(\text{Opt}[j - 1, K], \text{Opt}[j - 1, K - w_j] + v_j)$$

Knapsack Recurrence:

## Knapsack Grid

$$\text{Opt}[j, K] = \max(\text{Opt}[j - 1, K], \text{Opt}[j - 1, K - w_j] + v_j)$$

## Dynamic Programming Examples

- Examples
  - Optimal Billboard Placement
    - Text, Solved Exercise, Pg 307
  - Linebreaking with hyphenation
    - Compare with HW problem 6, Pg 317
  - String approximation
    - Text, Solved Exercise, Page 309

## Billboard Placement

- Maximize income in placing billboards
  - $b_i = (p_i, v_i)$ ,  $v_i$ : value of placing billboard at position  $p_i$
- Constraint:
  - At most one billboard every five miles
- Example
  - $\{(6,5), (8,6), (12, 5), (14, 1)\}$

## Design a Dynamic Programming Algorithm for Billboard Placement

- Compute  $Opt[1], Opt[2], \dots, Opt[n]$
- What is  $Opt[k]$ ?

Input  $b_1, \dots, b_n$ , where  $b_i = (p_i, v_i)$ , position and value of billboard i

$$Opt[k] = \text{fun}(Opt[0], \dots, Opt[k-1])$$

- How is the solution determined from sub problems?

Input  $b_1, \dots, b_n$ , where  $b_i = (p_i, v_i)$ , position and value of billboard i

## Solution

```
j = 0;           // j is five miles behind the current position
                // the last valid location for a billboard, if one placed at P[k]
for k := 1 to n
    while (P[j] < P[k] - 5)
        j := j + 1;
    j := j - 1;
    Opt[k] = Max(Opt[k-1], V[k] + Opt[j]);
```
