Memory Efficient Dynamic
Programming

Longest Common Subsequence

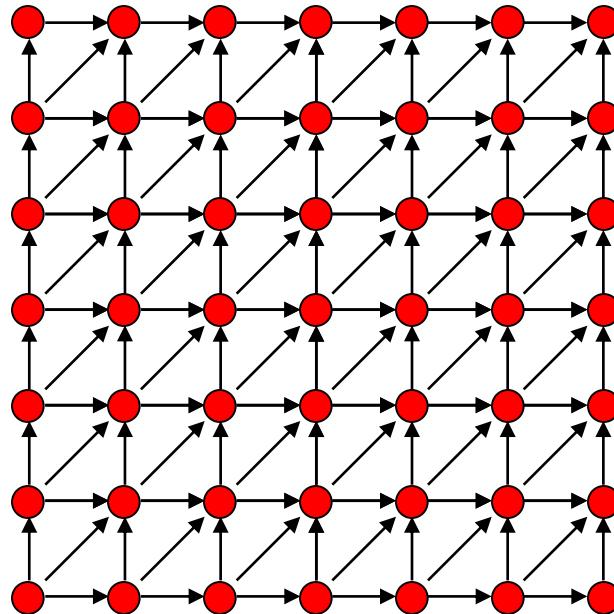

- $C=c_1\dots c_g$ is a subsequence of $A=a_1\dots a_m$ if C can be obtained by removing elements from A (but retaining order)
- $\text{LCS}(A, B)$: A maximum length sequence that is a subsequence of both A and B

$\text{LCS}(\text{BARTHOLEMESIMPSON}, \text{KRUSTYTHECLOWN})$
= RTHOWN

LCS Optimization

- $A = a_1a_2\dots a_m$, $B = b_1b_2\dots b_n$
- $\text{Opt}[j, k]$ is the length of $\text{LCS}(a_1a_2\dots a_j, b_1b_2\dots b_k)$
- Optimization Recurrence:
 - If $a_j = b_k$, $\text{Opt}[j, k] = 1 + \text{Opt}[j-1, k-1]$
 - If $a_j \neq b_k$, $\text{Opt}[j, k] = \max(\text{Opt}[j-1, k], \text{Opt}[j, k-1])$

Dynamic Programming Computation

Code to compute Opt[n, m]

```
for (int i = 0; i < n; i++)
    for (int j = 0; j < m; j++)
        if (A[ i ] == B[ j ] )
            Opt[ i,j ] = Opt[ i-1, j-1 ] + 1;
        else if (Opt[ i-1, j ] >= Opt[ i, j-1 ])
            Opt[ i, j ] := Opt[ i-1, j ];
        else
            Opt[ i, j ] := Opt[ i, j-1];
```

Storing the path information

A[1..m], B[1..n]

for i := 1 to m Opt[i, 0] := 0;

for j := 1 to n Opt[0,j] := 0;

Opt[0,0] := 0;

for i := 1 to m

 for j := 1 to n

 if A[i] = B[j] { Opt[i,j] := 1 + Opt[i-1,j-1]; Best[i,j] := Diag; }

 else if Opt[i-1, j] >= Opt[i, j-1]

 { Opt[i, j] := Opt[i-1, j], Best[i,j] := Left; }

 else { Opt[i, j] := Opt[i, j-1], Best[i,j] := Down; }

Reconstructing Path from Distances

How good is this algorithm?

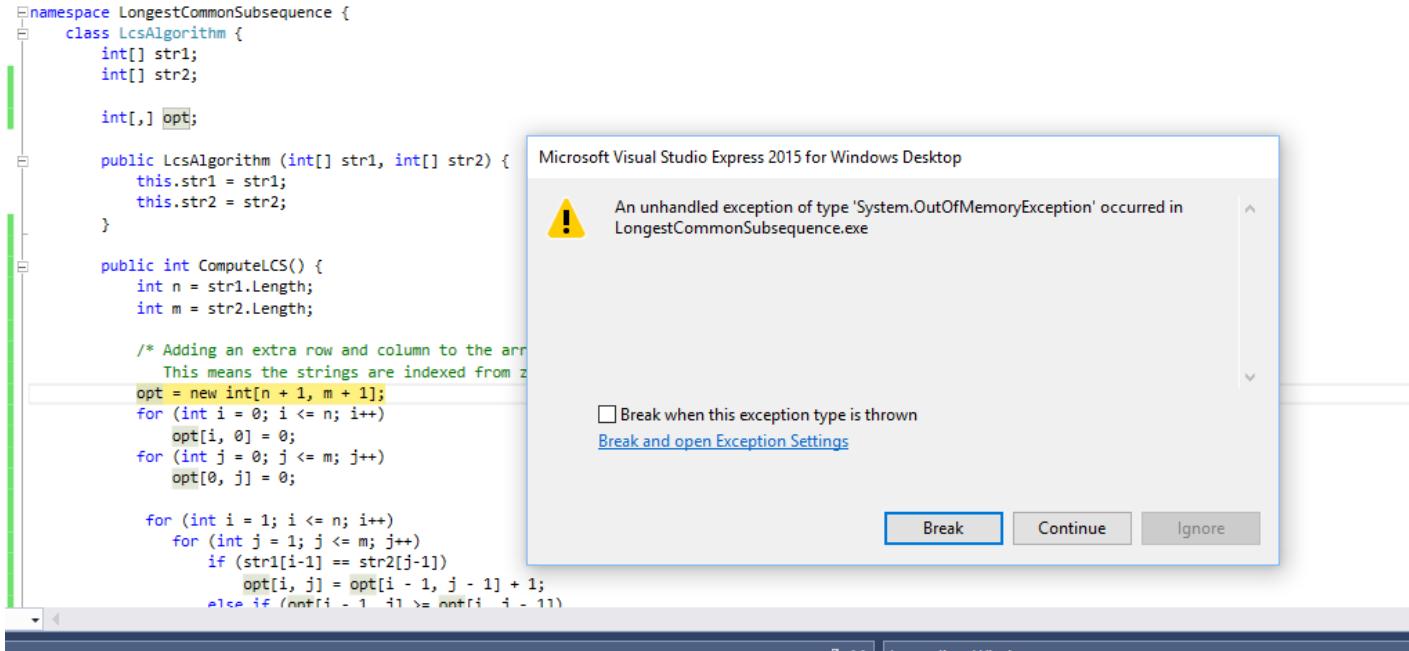

- Is it feasible to compute the LCS of two strings of length 300,000 on a standard desktop PC? Why or why not.

Implementation 1

```
public int ComputeLCS() {  
    int n = str1.Length;  
    int m = str2.Length;  
  
    int[,] opt = new int[n + 1, m + 1];  
    for (int i = 0; i <= n; i++)  
        opt[i, 0] = 0;  
    for (int j = 0; j <= m; j++)  
        opt[0, j] = 0;  
  
    for (int i = 1; i <= n; i++)  
        for (int j = 1; j <= m; j++)  
            if (str1[i-1] == str2[j-1])  
                opt[i, j] = opt[i - 1, j - 1] + 1;  
            else if (opt[i - 1, j] >= opt[i, j - 1])  
                opt[i, j] = opt[i - 1, j];  
            else  
                opt[i, j] = opt[i, j - 1];  
  
    return opt[n,m];  
}
```

N = 17000

Runtime should be about 5 seconds*

* Personal PC, 6 years old

Manufacturer: Dell
Model: Optiplex 990
Processor: Intel(R) Core(TM) i5-2400 CPU @ 3.10GHz 3.10 GHz
Installed memory (RAM): 8.00 GB (7.88 GB usable)
System type: 64-bit Operating System, x64-based processor

Implementation 2

```
public int SpaceEfficientLCS() {
    int n = str1.Length;
    int m = str2.Length;
    int[] prevRow = new int[m + 1];
    int[] currRow = new int[m + 1];

    for (int j = 0; j <= m; j++)
        prevRow[j] = 0;

    for (int i = 1; i <= n; i++) {
        currRow[0] = 0;
        for (int j = 1; j <= m; j++) {
            if (str1[i - 1] == str2[j - 1])
                currRow[j] = prevRow[j - 1] + 1;
            else if (prevRow[j] >= currRow[j - 1])
                currRow[j] = prevRow[j];
            else
                currRow[j] = currRow[j - 1];
        }
        for (int j = 1; j <= m; j++)
            prevRow[j] = currRow[j];
    }

    return currRow[m];
}
```

Observations about the Algorithm

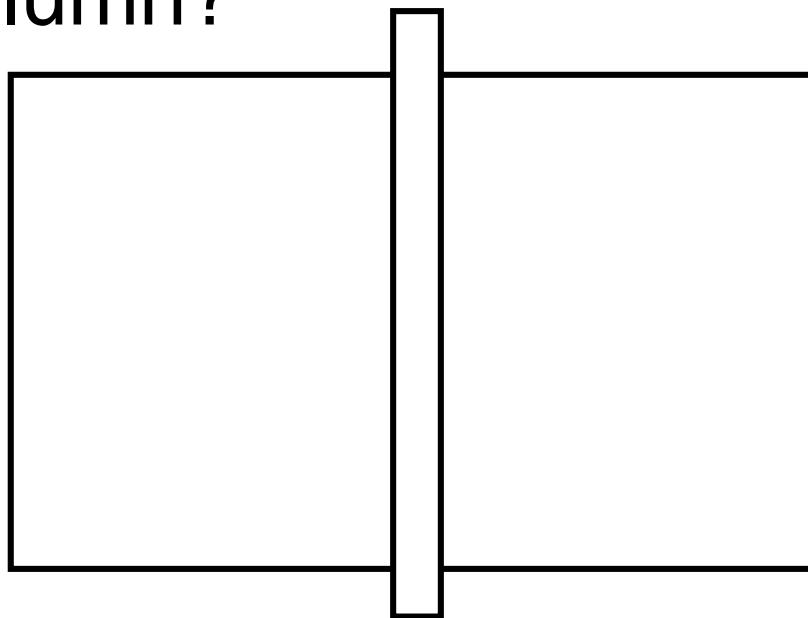

- The computation can be done in $O(m+n)$ space if we only need one column of the Opt values or Best Values
- The algorithm can be run from either end of the strings

Computing LCS in $O(nm)$ time and $O(n+m)$ space

- Divide and conquer algorithm
- Recomputing values used to save space

Divide and Conquer Algorithm

- Where does the best path cross the middle column?

- For a fixed i , and for each j , compute the LCS that has a_i matched with b_j

Constrained LCS

- $\text{LCS}_{i,j}(A,B)$: The LCS such that
 - a_1, \dots, a_i paired with elements of b_1, \dots, b_j
 - a_{i+1}, \dots, a_m paired with elements of b_{j+1}, \dots, b_n
- $\text{LCS}_{4,3}(\text{abbacbb, cbbaa})$

A = RRSSSRTTTRTS

B=RTSRRSTST

Compute $\text{LCS}_{5,0}(A,B)$, $\text{LCS}_{5,1}(A,B), \dots, \text{LCS}_{5,9}(A,B)$

A = RRSSSRTTTRTS

B=RTSRRSTST

Compute $\text{LCS}_{5,0}(A,B)$, $\text{LCS}_{5,1}(A,B), \dots, \text{LCS}_{5,9}(A,B)$

j	left	right
0	0	4
1	1	4
2	1	3
3	2	3
4	3	3
5	3	2
6	3	2
7	3	1
8	4	1
9	4	0

Computing the middle column

- From the left, compute $\text{LCS}(a_1 \dots a_{m/2}, b_1 \dots b_j)$
- From the right, compute $\text{LCS}(a_{m/2+1} \dots a_m, b_{j+1} \dots b_n)$
- Add values for corresponding j's

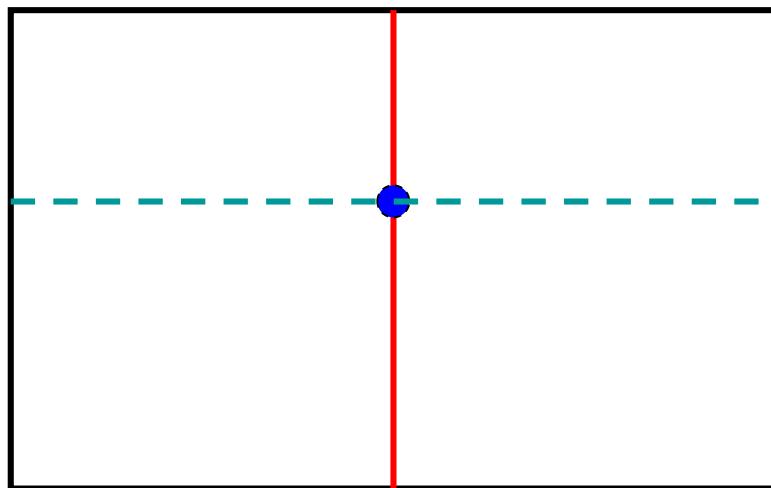

- Note – this is space efficient

Divide and Conquer

- $A = a_1, \dots, a_m$ $B = b_1, \dots, b_n$
- Find j such that
 - $\text{LCS}(a_1 \dots a_{m/2}, b_1 \dots b_j)$ and
 - $\text{LCS}(a_{m/2+1} \dots a_m, b_{j+1} \dots b_n)$ yield optimal solution
- Recurse

Algorithm Analysis

- $T(m,n) = T(m/2, j) + T(m/2, n-j) + cnm$

Prove by induction that
 $T(m,n) \leq 2cmn$

$$T(m,n) = T(m/2, j) + T(m/2, n-j) + cnm$$

Memory Efficient LCS Summary

- We can afford $O(nm)$ time, but we can't afford $O(nm)$ space
- If we only want to compute the length of the LCS, we can easily reduce space to $O(n+m)$
- Avoid storing the value by recomputing values
 - Divide and conquer used to reduce problem sizes
