Reductions / P vs NP

Shayan Oveis Gharan

Reductions & NP-Completeness

Polynomial Time Reduction

Def A $\leq_P$ B: if there is an algorithm for problem A using a ‘black box’ (subroutine) that solve problem B s.t.,

- Algorithm uses only a polynomial number of steps
- Makes only a polynomial number of calls to a subroutine for **B**

So,

B is Polynomial time solvable → A is Polynomial time solvable

Conversely,

No efficient Algorithm for A → No efficient Algorithm for B

In words, B is as hard as A (it can be even harder)

$\leq_p^1$ Reductions

A restricted form of polynomial-time reduction often called Karp or many-to-one reduction

$A \leq_p^1 B$: if and only if there is an algorithm for A given a black box solving B that on input x

- Runs for polynomial time computing an input f(x) of B
- Makes one call to the black box for B for input f(x)
- Returns the answer that the black box gave

We say that the function f(.) is the reduction

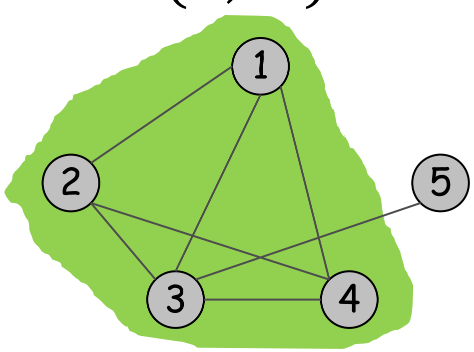
Example 1: Indep Set $\leq_p$ Clique

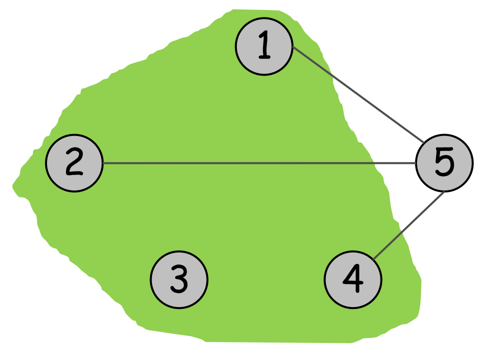
Indep Set: Given G=(V,E) and an integer k, is there $S \subseteq V$ s.t. $|S| \geq k$ an no two vertices in S are joined by an edge?

Clique: Given a graph G=(V,E) and an integer k, is there $S \subseteq V$, |~~U~~ S| $\geq$ k s.t., every pair of vertices in S is joined by an edge?

Claim: Indep Set $\leq_p$ Clique

Pf: Given $G = (V, E)$ an instance of indep Set. Construct a new graph $G' = (V, E')$ where $\{u, v\} \in E'$ if and only if $\{u, v\} \notin E$.





S is an independ set in G ⟷ S is an Clique in G'

Example 2: Vertex Cover $\leq_p$ Indep Set

Vertex Cover: Given a graph G=(V,E) and an integer k, is there a vertex cover of size at most k?

Claim: For any graph $G = (V, E)$, S is an independent set iff $V - S$ is a vertex cover

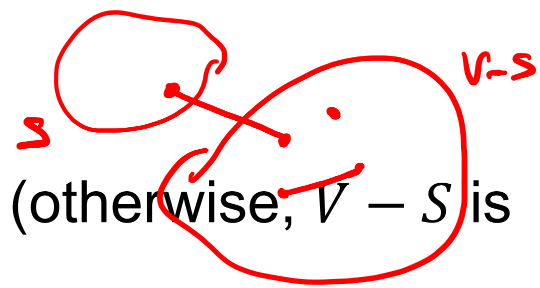
Pf:

=> Let S be a independent set of G

Then, S has at most one endpoint of every edge of G

So, $V - S$ has at least one endpoint of every edge of G

So, $V - S$ is a vertex cover.



<= Suppose $V - S$ is a vertex cover

Then, there is no edge between vertices of S (otherwise, $V - S$ is not a vertex cover)

So, S is an independent set.

Example 3: Vertex Cover $\leq_p$ Set Cover

Set Cover: Given a set U, collection of subsets $S_1, \dots, S_m$ of U and an integer k, is there a collection of k sets that contain all elements of U?

Claim: Vertex Cover $\leq_p$ Set Cover

Pf:

Given $(G = (V, E), k)$ of vertex cover we construct a set cover input $f(G, k)$

- $U = E$
- For each $v \in V$ we create a set S_v of all edges connected to v

This clearly is a polynomial-time reduction

So, we need to prove it gives the right answer

Example 3: Vertex Cover $\leq_p$ Set Cover

Claim: Vertex Cover $\leq_p$ Set Cover
Pf: Given $(G = (V, E), k)$ of vertex cover we construct a set cover input $f(G, k)$

- $U = E$
- For each $v \in V$ we create a set S_v of all edges connected to v

Vertex-Cover (G,k) is yes => Set-Cover f(G,k) is yes
If a set $W \subseteq V$ covers all edges,, just choose S_v for all $v \in W$, it covers all U.

Set-Cover f(G,k) is yes => Vertex-Cover (G,k) is yes
If $(S_{v_1}, \ldots, S_{v_k})$ covers all U, the set $\{v_1, \ldots, v_k\}$ covers all edges of G.

$\leq_p^m$ Reductions

Sometimes we solve problem A by reducing it to many copies of problem B

$A \leq_p^m B$: if and only if there is an algorithm for A given a black box solving B that on input x

- Runs for polynomial time computing inputs $f_1(x), \ldots, f_m(x)$ of B where m is a polynomial on length of x.
- Makes m calls to the black box for B for each input $f_i(x)$
- Returns yes if one of calls to B answers yes and no otherwise.

We say that the function f(.) is the reduction
