

## CSE 421 Algorithms

Richard Anderson  
Autumn 2019  
Lecture 6

## Announcements

- No class Monday
  - Richard Anderson will shift office hours to Tuesday, 3:30-4:30 pm, Jan 22 (CSE 582)
- Reading
  - Start on Chapter 4

## Stable Matching Results

- Averages of 5 runs
- Much better for M than W
- Why is it better for M?
- What is the growth of m-rank and w-rank as a function of  $n$ ?

$n$	m-rank	w-rank
500	5.10	98.05
500	7.52	66.95
500	8.57	58.18
500	6.32	75.87
500	5.25	90.73
500	6.55	77.95
1000	6.80	146.93
1000	6.50	154.71
1000	7.14	133.53
1000	7.44	128.96
1000	7.36	137.85
1000	7.04	140.40
2000	7.83	257.79
2000	7.50	263.78
2000	11.42	175.17
2000	7.16	274.76
2000	7.54	261.60
2000	8.29	246.62

## Graph Theory

- $G = (V, E)$ 
  - $V$ : vertices,  $|V| = n$
  - $E$ : edges,  $|E| = m$
- Undirected graphs
  - Edges sets of two vertices  $\{u, v\}$
- Directed graphs
  - Edges ordered pairs  $(u, v)$
- Many other flavors
  - Edge / vertices weights
  - Parallel edges
  - Self loops
- Path:  $v_1, v_2, \dots, v_k$ , with  $(v_i, v_{i+1}) \in E$ 
  - Simple Path
  - Cycle
  - Simple Cycle
- Neighborhood
  - $N(v)$
- Distance
- Connectivity
  - Undirected
  - Directed (strong connectivity)
- Trees
  - Rooted
  - Unrooted

## Last Lecture

- Bipartite Graphs : two-colorable graphs
- Breadth First Search algorithm for testing two-colorability
  - Two-colorable iff no odd length cycle
  - BFS has cross edge iff graph has odd cycle

## Graph Search

- Data structure for next vertex to visit determines search order

## Graph search

### Breadth First Search

```

S = {s}
while S is not empty
  u = Dequeue(S)
  if u is unvisited
    visit u
    foreach v in N(u)
      Enqueue(S, v)
  
```

### Depth First Search

```

S = {s}
while S is not empty
  u = Pop(S)
  if u is unvisited
    visit u
    foreach v in N(u)
      Push(S, v)
  
```

## Breadth First Search

- All edges go between vertices on the same layer or adjacent layers

## Depth First Search

- Each edge goes between vertices on the same branch
- No cross edges

## Connected Components

- Undirected Graphs

## Computing Connected Components in $O(n+m)$ time

- A search algorithm from a vertex  $v$  can find all vertices in  $v$ 's component
- While there is an unvisited vertex  $v$ , search from  $v$  to find a new component

## Directed Graphs

- A Strongly Connected Component is a subset of the vertices with paths between every pair of vertices.

### Identify the Strongly Connected Components

Strongly connected components can be found in  $O(n+m)$  time

- But it's tricky!
- Simpler problem: given a vertex  $v$ , compute the vertices in  $v$ 's scc in  $O(n+m)$  time

### Topological Sort

- Given a set of tasks with precedence constraints, find a linear order of the tasks

Find a topological order for the following graph

If a graph has a cycle, there is no topological sort

- Consider the first vertex on the cycle in the topological sort
- It must have an incoming edge

Definition: A graph is Acyclic if it has no cycles

Lemma: If a (finite) graph is acyclic, it has a vertex with in-degree 0

- Proof:
  - Pick a vertex  $v_1$ , if it has in-degree 0 then done
  - If not, let  $(v_2, v_1)$  be an edge, if  $v_2$  has in-degree 0 then done
  - If not, let  $(v_3, v_2)$  be an edge . . .
  - If this process continues for more than  $n$  steps, we have a repeated vertex, so we have a cycle

## Topological Sort Algorithm

While there exists a vertex  $v$  with in-degree 0

Output vertex  $v$

Delete the vertex  $v$  and all out going edges

## Details for $O(n+m)$ implementation

- Maintain a list of vertices of in-degree 0
- Each vertex keeps track of its in-degree
- Update in-degrees and list when edges are removed
- $m$  edge removals at  $O(1)$  cost each
