

# CSE 421 Algorithms

Autumn 2019  
Lecture 9  
Dijkstra's algorithm

## Last Week – Greedy Algorithms

- Task scheduling to minimize maximum lateness

- Interchange lemma

- Farthest in the future algorithm for optimal caching
  - Discard element whose first occurrence is last in the sequence

A, B, C, A, C, D, C, B, C, A, D

## Announcement

- Collaboration Policy
  - Discussing problems with other students is okay
  - Write ups must be done independently
  - Acknowledge people you work with

## This week

- Topics
  - Dijkstra's Algorithm (Section 4.4)
  - Wednesday: Shortest Paths / Minimum Spanning Trees
  - Friday: Minimum Spanning Trees
- Reading
  - 4.4, 4.5, 4.7, 4.8

## Single Source Shortest Path Problem

- Given a graph and a start vertex  $s$ 
  - Determine distance of every vertex from  $s$
  - Identify shortest paths to each vertex
    - Express concisely as a "shortest paths tree"
    - Each vertex has a pointer to a predecessor on shortest path

## Construct Shortest Path Tree from $s$

## Warmup

- If  $P$  is a shortest path from  $s$  to  $v$ , and if  $t$  is on the path  $P$ , the segment from  $s$  to  $t$  is a shortest path between  $s$  and  $t$

- WHY?

Assume all edges have non-negative cost

## Dijkstra's Algorithm

$S = \{s\}$ ;  $d[s] = 0$ ;  $d[v] = \text{infinity}$  for  $v \neq s$

While  $S \neq V$

Choose  $v$  in  $V - S$  with minimum  $d[v]$

Add  $v$  to  $S$

For each  $w$  in the neighborhood of  $v$

$d[w] = \min(d[w], d[v] + c(v, w))$

## Simulate Dijkstra's algorithm (starting from s) on the graph

Round	Vertex Added	s	a	b	c	d
1						
2						
3						
4						
5						

## Who was Dijkstra?

- What were his major contributions?

<http://www.cs.utexas.edu/users/EWD/>

- Edsger Wybe Dijkstra was one of the most influential members of computing science's founding generation. Among the domains in which his scientific contributions are fundamental are
  - algorithm design
  - programming languages
  - program design
  - operating systems
  - distributed processing
  - formal specification and verification
  - design of mathematical arguments

## Dijkstra's Algorithm as a greedy algorithm

- Elements committed to the solution by order of minimum distance

## Correctness Proof

- Elements in S have the correct label
- Key to proof: when v is added to S, it has the correct distance label.

## Proof

- Let v be a vertex in V-S with minimum d[v]
- Let  $P_v$  be a path of length d[v], with an edge (u,v)
- Let P be some other path to v. Suppose P first leaves S on the edge (x, y)
  - $P = P_{sx} + c(x,y) + P_{yv}$
  - $\text{Len}(P_{sx}) + c(x,y) \geq d[y]$
  - $\text{Len}(P_{yv}) \geq 0$
  - $\text{Len}(P) \geq d[y] + 0 \geq d[v]$

## Negative Cost Edges

- Draw a small example a negative cost edge and show that Dijkstra's algorithm fails on this example

## Bottleneck Shortest Path

- Define the bottleneck distance for a path to be the maximum cost edge along the path

## Compute the bottleneck shortest paths

How do you adapt Dijkstra's algorithm to handle bottleneck distances

- Does the correctness proof still apply?
