## Greedy Alg: Minimum Spanning Tree

Shayan Oveis Gharan

# An Advice on Problem Solving

If possible, try **not to** use arguments of the following type in proofs:

- The Best case is ....
- The worst case is ....
- The slowest running time for my algorithm is ....

These arguments need **rigorous** justification, and they are usually the main reason that your proofs can become wrong, or unjustified.

# Minimum Spanning Tree (MST)

Given a connected graph  $G = (V, E)$  with real-valued edge weights  $c_e$ , an MST is a subset of the edges  $T \subseteq E$  such that  $T$  is a spanning tree whose sum of edge weights is minimized.

$$G = (V, E)$$

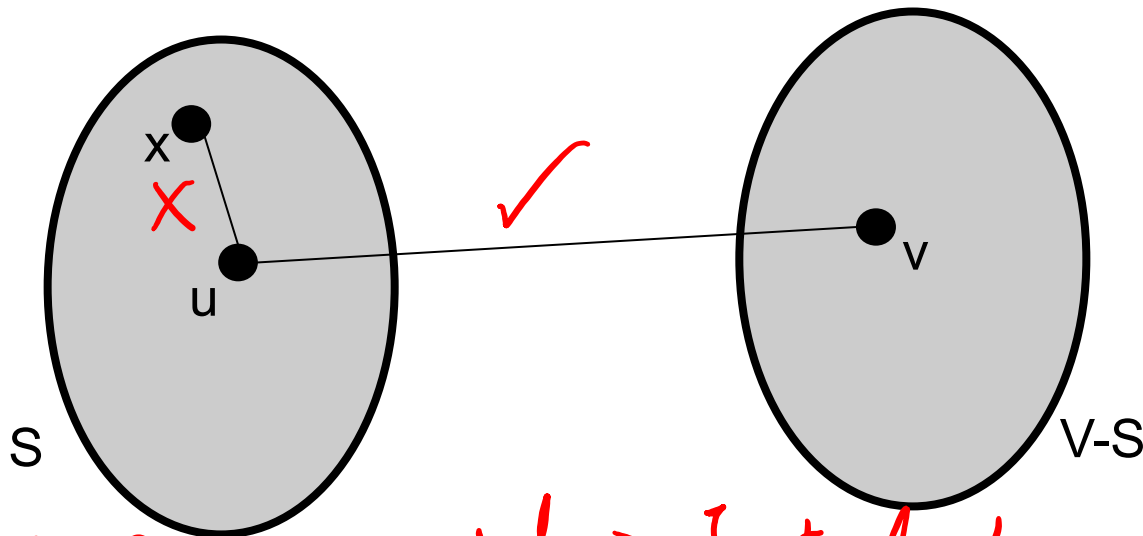

$$c(T) = \sum_{e \in T} c_e = 50$$

# Cuts

In a graph  $G = (V, E)$  a cut is a **bipartition** of  $V$  into sets  $S, V - S$  for some  $S \subseteq V$ . We show it by  $(S, V - S)$

An edge  $e = \{u, v\}$  is in the cut  $(S, V - S)$  if exactly one of  $u, v$  is in  $S$ .

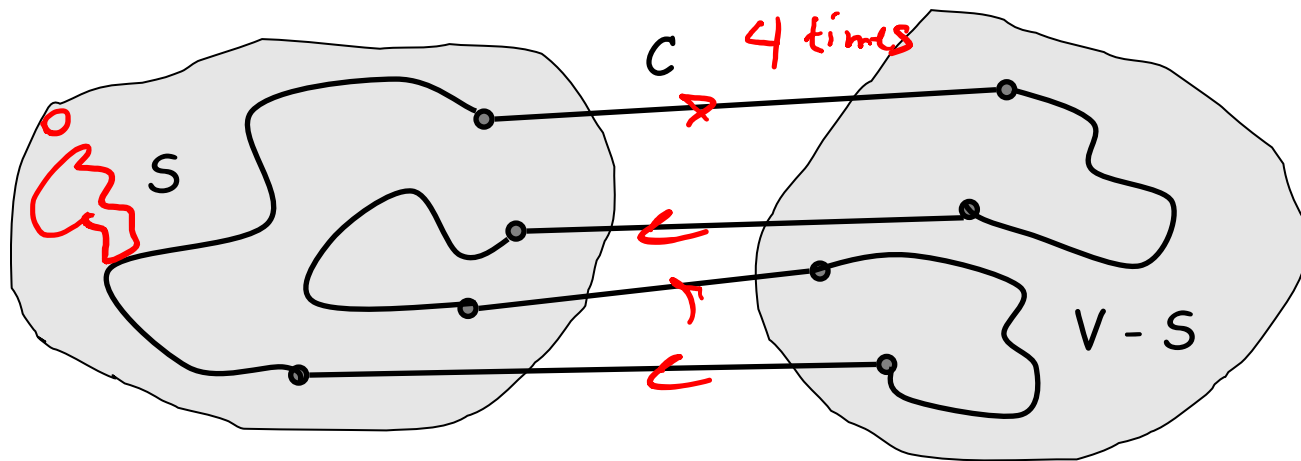

*ⓄBS: If  $G$  is connected  $\Rightarrow \exists$  at least one edge in any cut.*

# Cycles and Cuts

**Claim.** A cycle crosses a cut (from  $S$  to  $V-S$ ) an even number of times.

**Pf.** (by picture)

# Properties of the OPT

**Simplifying assumption:** All edge costs  $c_e$  are distinct.

**Cut property:** Let  $S$  be any subset of nodes (called a cut), and let  $e$  be the **min** cost edge with exactly one endpoint in  $S$ . Then **every** MST contains  $e$ .

**Cycle property.** Let  $C$  be any cycle, and let  $f$  be the **max** cost edge belonging to  $C$ . Then **no** MST contains  $f$ .

**red edge** is in the MST

**Green edge** is not in the MST

# Cut Property: Proof

**Simplifying assumption:** All edge costs  $c_e$  are distinct.

**Cut property.** Let  $S$  be any subset of nodes, and let  $e$  be the **min** cost edge with exactly one endpoint in  $S$ . Then the  $T^*$  contains  $e$ .

**Pf.** By contradiction

Suppose  $e = \{u, v\}$  does not belong to  $T^*$ .

Adding  $e$  to  $T^*$  creates a cycle  $C$  in  $T^*$ .

$C$  crosses  $S$  even number of times  $\Rightarrow$  there exists another edge, say  $f$ , that leaves  $S$ .

$T = T^* \cup \{e\} - \{f\}$  is also a spanning tree.

Since  $c_e < c_f$ ,  $c(T) < c(T^*)$ .

This is a contradiction.

# Cycle Property: Proof

**Simplifying assumption:** All edge costs  $c_e$  are distinct.

**Cycle property:** Let  $C$  be any cycle in  $G$ , and let  $f$  be the **max** cost edge belonging to  $C$ . Then the MST  $T^*$  does not contain  $f$ .

**Pf.** (By contradiction)

Suppose  $f$  belongs to  $T^*$ .

Deleting  $f$  from  $T^*$  cuts  $T^*$  into two connected components.

There exists another edge, say  $e$ , that is in the cycle and connects the components.

$T = T^* \cup \{e\} - \{f\}$  is also a spanning tree.

Since  $c_e < c_f$ ,  $c(T) < c(T^*)$ .

This is a contradiction.

# Kruskal's Algorithm [1956]

```
Kruskal(G, c) {  
  Sort edges weights so that  $c_1 \leq c_2 \leq \dots \leq c_m$ .  
   $T \leftarrow \emptyset$   
  
  foreach ( $u \in V$ ) make a set containing singleton  $\{u\}$   
  
  for i = 1 to m  
    Let  $(u, v) = e_i$   
    if (u and v are in different sets) {  
       $T \leftarrow T \cup \{e_i\}$   
      merge the sets containing u and v  
    }  
  return T  
}
```

# Kruskal's Algorithm: Pf of Correctness

Consider edges in ascending order of weight.

**Case 1:** If adding  $e$  to  $T$  creates a cycle, discard  $e$  according to cycle property.

**Case 2:** Otherwise, insert  $e = (u, v)$  into  $T$  according to cut property where  $S =$  set of nodes in  $u$ 's connected component.

Case 1

Case 2

# Implementation: Kruskal's Algorithm

Implementation. Use the **union-find** data structure.

- Build set  $T$  of edges in the MST.
- Maintain a set for each connected component.
- $O(m \log n)$  for sorting and  $O(m \log n)$  for union-find

```
Kruskal(G, c) {  
  Sort edges weights so that  $c_1 \leq c_2 \leq \dots \leq c_m$ .  
   $T \leftarrow \emptyset$   
  
  foreach ( $u \in V$ ) make a set containing singleton  $\{u\}$   
  
  for i = 1 to m  
    Let  $(u, v) = e_i$  ↗  $O(\log n)$   
    if (u and v are in different sets) {  
       $T \leftarrow T \cup \{e_i\}$   
      merge the sets containing  $u$  and  $v$   
    }  
  return  $T$  ↖  $O(1)$   
}
```
