

### CSE 421 Introduction to Algorithm

Greedy Algorithms Winter 2024 Lecture 5

### Announcements

- Reading
  - For today, sections 4.1, 4.2,
  - For Friday, sections 4.4, 4.5, 4.7, 4.8
- No class on Monday

## Greedy Algorithms

- Solve problems with the simplest possible algorithm
- The hard part: showing that something simple actually works
- Pseudo-definition

 An algorithm is Greedy if it builds its solution by adding elements one at a time using a simple rule

## Scheduling Theory

- Tasks
  - Processing requirements, release times, deadlines
- Processors
- Precedence constraints
- Objective function

- Jobs scheduled, lateness, total execution time

### Interval Scheduling

- Tasks occur at fixed times
- Single processor
- Maximize number of tasks completed

- Tasks {1, 2, . . ., n}
- Start and finish times, s(i), f(i)

### What is the largest solution?

### Greedy Algorithm for Scheduling

Let T be the set of tasks, construct a set of independent tasks I, A is the rule determining the greedy algorithm

 $\mathsf{I}=\{ \ \}$ 

While (T is not empty)

Select a task t from T by a rule A

Add t to I

Remove t and all tasks incompatible with t from T

### **Interval Scheduling Heuristics**

- Earliest starting time first
- Shortest interval first
- Smallest number of conflicting tasks
- Earliest finishing time first

# Simulate the greedy algorithm for each of these heuristics

Schedule earliest starting task

Schedule shortest available task

Schedule task with fewest conflicting tasks

# Greedy solution based on earliest finishing time

Example 1

Example 2

Example 3

# Theorem: Earliest Finish Algorithm is Optimal

- Key idea: Earliest Finish Algorithm stays ahead
- Let  $A = \{i_1, \ldots, i_k\}$  be the set of tasks found by EFA in increasing order of finish times
- Let  $B = \{j_1, \ldots, j_m\}$  be the set of tasks found by a different algorithm in increasing order of finish times
- Show that for  $r \le \min(k, m)$ ,  $f(i_r) \le f(j_r)$

### Stay ahead lemma

- A always stays ahead of B,  $f(i_r) \le f(j_r)$
- Induction argument

$$-f(i_1) \le f(j_1)$$

- If  $f(i_{r-1}) \leq f(j_{r-1})$  then  $f(i_r) \leq f(j_r)$ 

### Completing the proof

- Let  $A = \{i_1, \ldots, i_k\}$  be the set of tasks found by EFA in increasing order of finish times
- Let  $O = \{j_1, \ldots, j_m\}$  be the set of tasks found by an optimal algorithm in increasing order of finish times
- If k < m, then the Earliest Finish Algorithm stopped before it ran out of tasks

### Scheduling all intervals

 Minimize number of processors to schedule all intervals

# How many processors are needed for this example?

#### Prove that you cannot schedule this set of intervals with two processors

# Depth: maximum number of intervals active

### Algorithm

- Sort by start times
- Suppose maximum depth is d, create d slots
- Schedule items in increasing order, assign each item to an open slot

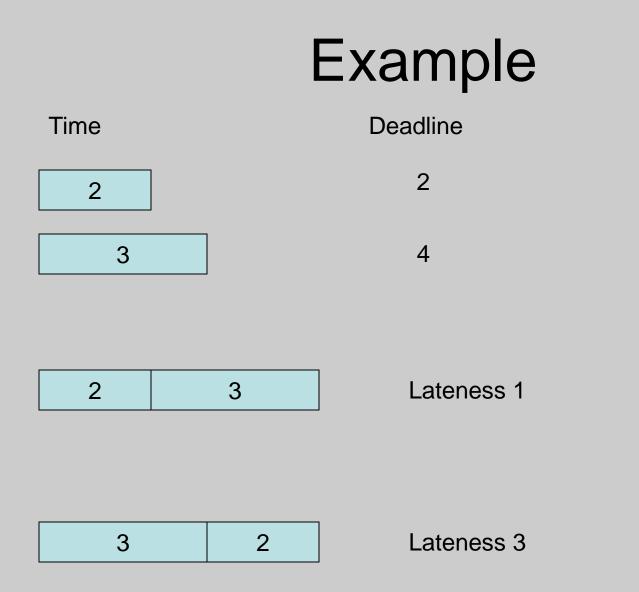

Correctness proof: When we reach an item, we always have an open slot

### Scheduling tasks

- Each task has a length t<sub>i</sub> and a deadline d<sub>i</sub>
- All tasks are available at the start
- One task may be worked on at a time
- All tasks must be completed

Goal minimize maximum lateness

-Lateness =  $f_i - d_i$  if  $f_i \ge d_i$ 

### Determine the minimum lateness
