## Lecture 16:

### Max Flow Min Cut

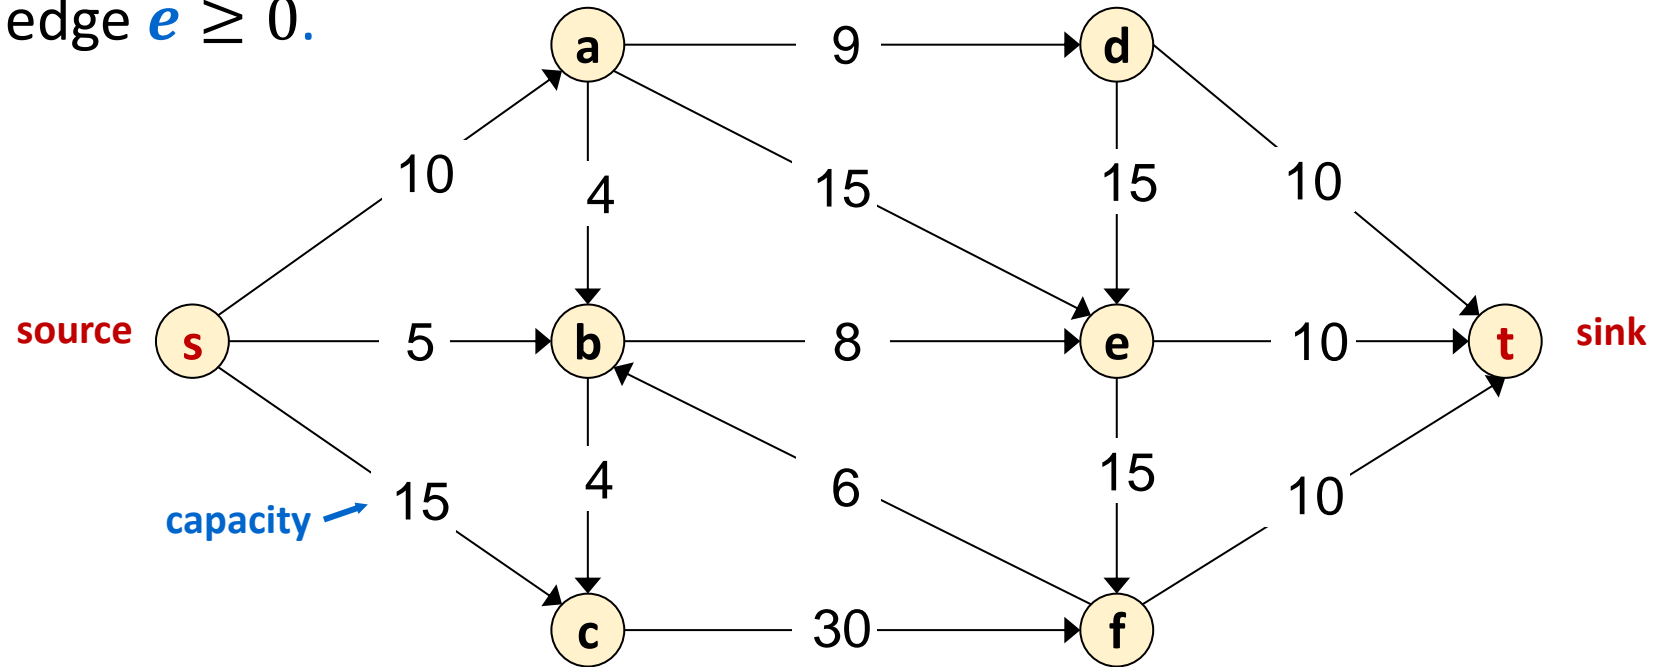

Nathan Brunelle

<http://www.cs.uw.edu/421>

# Flow Network

## Flow network:

- Abstraction for material *flowing* through the edges.
- $G = (V, E)$  directed graph, no parallel edges.
- Two distinguished nodes:  $s = \text{source}$ ,  $t = \text{sink}$ .
- $c(e) = \text{capacity of edge } e \geq 0$ .

# Flows

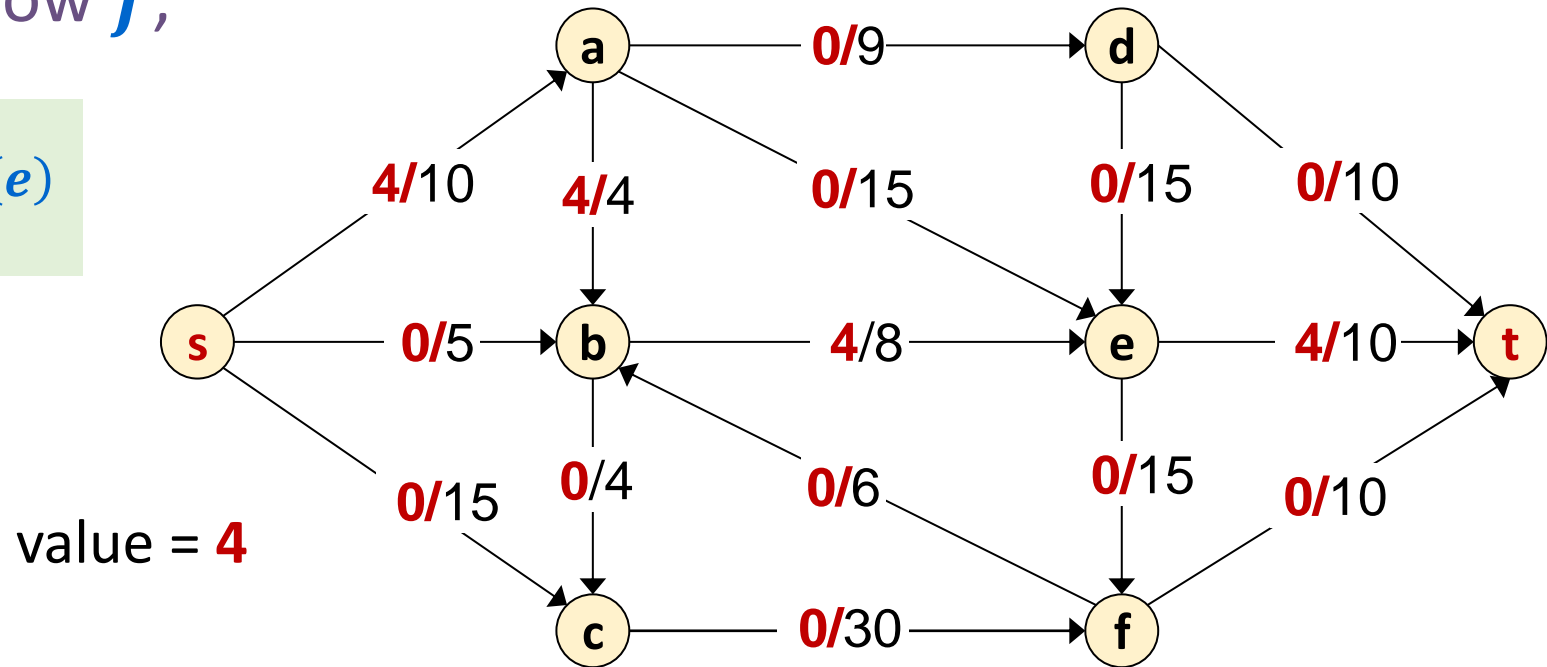

**Defn:** An **s-t flow** in a flow network is a function  $f: E \rightarrow \mathbb{R}$  that satisfies:

- For each  $e \in E$ :  $0 \leq f(e) \leq c(e)$  [capacity constraints]

- For each  $v \in V - \{s, t\}$ :  $\sum_{e \text{ into } v} f(e) = \sum_{e \text{ out of } v} f(e)$  [flow conservation]

**Defn:** The **value** of flow  $f$ ,

$$v(f) = \sum_{e \text{ out of } s} f(e)$$

# Flows

**Defn:** An **s-t flow** in a flow network is a function  $f: E \rightarrow \mathbb{R}$  that satisfies:

- For each  $e \in E$ :  $0 \leq f(e) \leq c(e)$  [capacity constraints]

- For each  $v \in V - \{s, t\}$ :  $\sum_{e \text{ into } v} f(e) = \sum_{e \text{ out of } v} f(e)$  [flow conservation]

**Defn:** The **value** of flow  $f$ ,

$$v(f) = \sum_{e \text{ out of } s} f(e)$$

Only show non-zero values of  $f$

value = 4

# Flows

**Defn:** An **s-t flow** in a flow network is a function  $f: E \rightarrow \mathbb{R}$  that satisfies:

- For each  $e \in E$ :  $0 \leq f(e) \leq c(e)$  [capacity constraints]

- For each  $v \in V - \{s, t\}$ :  $\sum_{e \text{ into } v} f(e) = \sum_{e \text{ out of } v} f(e)$  [flow conservation]

**Defn:** The **value** of flow  $f$ ,

$$v(f) = \sum_{e \text{ out of } s} f(e)$$

Only show non-zero values of  $f$

value = **24**

# Maximum Flow Problem

**Given:** a flow network

**Find:** an *s-t* flow of maximum value

# Towards a Max Flow Algorithm

What about the following greedy algorithm?

- Start with  $f(e) = 0$  for all edges  $e \in E$ .
- While there is an  $s$ - $t$  path  $P$  where each edge has  $f(e) < c(e)$ .
  - “Augment” flow along  $P$ ; that is:
    - Let  $\alpha = \min_{e \in P} (c(e) - f(e))$
    - Add  $\alpha$  to flow on every edge  $e$  along path  $P$ . (Adds  $\alpha$  to  $v(f)$ .)

Can get stuck...

Has flow value **20**  
and no path  $P$

but **30** is possible

# Another “Stuck” Example

On every  $s$ - $t$  path there is some edge with  $f(e) = c(e)$ :

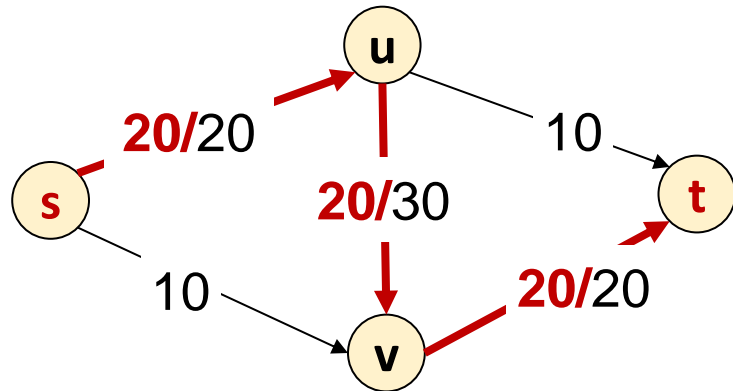

Value of flow = 24

**Next idea:** Ford-Fulkerson Algorithm, which applies greedy ideas to a “residual graph” that lets us reverse prior flow decisions from the basic greedy approach to get optimal results!

# Greed Revisited: Residual Graph & Augmenting Paths

The only way we could route more flow from **s** to **t** would be to reduce the flow from **u** to **v** to make room for that amount of extra flow from **s** to **v**. But to conserve flow we also would need to increase the flow from **u** to **t** by that same amount.

Suppose that we took this flow  $f$  as a baseline, what changes could each edge handle?

- We could add up to 10 units along **sv** or **ut** or **uv**
- We could reduce by up to 20 units from **su** or **uv** or **vt**

This gives us a **residual graph**  $G_f$  of possible changes where we draw reducing as “sending back”.

# Greed Revisited: Residual Graph & Augmenting Paths

# Greed Revisited: Residual Graph & Augmenting Paths

No path can even leave  $s$ !

# Residual Graphs

An alternative way to represent a flow network

- Represents the net available flow between two nodes

Original edge:  $e = (u, v) \in E$ .

- Flow  $f(e)$ , capacity  $c(e)$ .

Residual edges of two kinds:

- **Forward:**  $e = (u, v)$  with capacity  $c_f(e) = c(e) - f(e)$ 
  - Amount of extra flow we can add along  $e$
- **Backward:**  $e^R = (v, u)$  with capacity  $c_f(e) = f(e)$ 
  - Amount we can reduce/undo flow along  $e$

Residual graph:  $G_f = (V, E_f)$ .

- Residual edges with residual capacity  $c_f(e) > 0$ .
- $E_f = \{e : f(e) < c(e)\} \cup \{e^R : f(e) > 0\}$ .

# Residual Graphs and Augmenting Paths

Residual edges of two kinds:

- **Forward:**  $e = (u, v)$  with capacity  $c_f(e) = c(e) - f(e)$ 
  - Amount of extra flow we can add along  $e$
- **Backward:**  $e^R = (v, u)$  with capacity  $c_f(e) = f(e)$ 
  - Amount we can reduce/undo flow along  $e$

Residual graph:  $G_f = (V, E_f)$ .

- Residual edges with residual capacity  $c_f(e) > 0$ .
- $E_f = \{e : f(e) < c(e)\} \cup \{e^R : f(e) > 0\}$ .

**Augmenting Path:** Any  $s$ - $t$  path  $P$  in  $G_f$ . Let  $\text{bottleneck}(P) = \min_{e \in P} c_f(e)$ .

**Ford-Fulkerson idea:** Repeat “find an augmenting path  $P$  and increase flow by  $\text{bottleneck}(P)$ ” until none left.

# Cuts

**Defn:** An ***s-t* cut** is a partition  $(A, B)$  of  $V$  with  $s \in A$  and  $t \in B$ .

The **capacity** of cut  $(A, B)$  is

$$c(A, B) = \sum_{e \text{ out of } A} c(e)$$

# Cuts

**Defn:** An ***s-t* cut** is a partition  $(A, B)$  of  $V$  with  $s \in A$  and  $t \in B$ .

The **capacity** of cut  $(A, B)$  is

$$c(A, B) = \sum_{e \text{ out of } A} c(e)$$

# Minimum Cut Problem

Minimum s-t cut problem:

**Given:** a flow network

**Find:** an *s-t* cut of minimum capacity

# Flows and Cuts

Let  $f$  be any  $s$ - $t$  flow and  $(A, B)$  be any  $s$ - $t$  cut:

**Flow Value Lemma:** The net value of the flow sent across  $(A, B)$  equals  $v(f)$ .

**Intuition:** All flow coming from  $s$  must eventually reach  $t$ , and so must cross that cut

**Weak Duality:** The value of the flow is at most the capacity of the cut;  
i.e.,  $v(f) \leq c(A, B)$ .

**Intuition:** Since all flow must cross any cut, any cut's capacity is an upper bound on the flow

**Corollary:** If  $v(f) = c(A, B)$  then  $f$  is a maximum flow and  $(A, B)$  is a minimum cut.

**Intuition:** If we find a cut whose capacity matches the flow, we can't push more flow through that cut because it's already at capacity. We additionally can't find a smaller cut, since that flow was achievable.

# Certificate of Optimality

Let  $f$  be any  $s$ - $t$  flow and  $(A, B)$  be any  $s$ - $t$  cut.

If  $v(f) = c(A, B)$  then  $f$  is a max flow and  $(A, B)$  is a min cut.

Value of flow = **28**

Capacity of cut = **28**

Both are optimal!  
Each “certified”  
correctness of the other!

# Max-Flow Min-Cut Theorem

**Augmenting Path Theorem:** Flow  $f$  is a max flow  $\Leftrightarrow$  there are no augmenting paths wrt  $f$

**Max-Flow Min-Cut Theorem:** The value of the max flow equals the value of the min cut.

[Elias-Feinstein-Shannon 1956, Ford-Fulkerson 1956]      “Maxflow = Mincut”

**Proof:** We prove both together by showing that all of these are equivalent:

(i) There is a cut  $(A, B)$  such that  $v(f) = c(A, B)$ .

(ii) Flow  $f$  is a max flow.

(iii) There is no augmenting path w.r.t.  $f$ .

(i)  $\Rightarrow$  (ii): Comes from weak duality lemma.

(ii)  $\Rightarrow$  (iii): (by contradiction)

If there is an augmenting path w.r.t. flow  $f$  then we can improve  $f$ . Therefore  $f$  is not a max flow.

(iii)  $\Rightarrow$  (i): We will use the residual graph to identify a cut whose capacity matches the flow

# Flow Value Lemma – Idea

**Flow Value Lemma:** Let  $f$  be any  $s$ - $t$  flow and  $(A, B)$  be any  $s$ - $t$  cut. The net value of the flow sent across the cut equals  $v(f)$ :

$$\sum_{e \text{ out of } A} f(e) - \sum_{e \text{ into } A} f(e) = v(f)$$

Why is it true?

- Add vertices to  $s$  side one by one.
- By flow conservation, net value doesn't change

# Flow Value Lemma – Proof

**Flow Value Lemma:** Let  $f$  be any  $s$ - $t$  flow and  $(A, B)$  be any  $s$ - $t$  cut. The net value of the flow sent across the cut equals  $v(f)$ :

$$\sum_{e \text{ out of } A} f(e) - \sum_{e \text{ into } A} f(e) = v(f)$$

**Proof:**

$$\begin{aligned} v(f) &= \sum_{e \text{ out of } s} f(e) \\ &= \sum_{e \text{ out of } s} f(e) - \sum_{e \text{ into } s} f(e) + \sum_{v \in A - \{s\}} \left[ \sum_{e \text{ out of } v} f(e) - \sum_{e \text{ into } v} f(e) \right] \\ &= \sum_{e \text{ out of } A} f(e) - \sum_{e \text{ into } A} f(e) \end{aligned}$$

= 0. No edges into  $s$  since it is a source

Contributions from internal edges of  $A$  cancel.

= 0 by flow conservation.

# Weak Duality - Idea

**Weak Duality:** Let  $f$  be any  $s$ - $t$  flow and  $(A, B)$  be any  $s$ - $t$  cut. The value of the flow is at most the capacity of the cut; i.e.,  $v(f) \leq c(A, B)$ :

Value of flow = **24** = **28** - **4**

Capacity of cut = **28**

# Weak Duality - Proof

**Weak Duality:** Let  $f$  be any  $s$ - $t$  flow and  $(A, B)$  be any  $s$ - $t$  cut. The value of the flow is at most the capacity of the cut; i.e.,  $v(f) \leq c(A, B)$ .

**Proof:**

$$\begin{aligned} v(f) &= \sum_{e \text{ out of } A} f(e) - \sum_{e \text{ into } A} f(e) \\ &\leq \sum_{e \text{ out of } A} f(e) && \text{since } f(e) \geq 0 \\ &\leq \sum_{e \text{ out of } A} c(e) && \text{since } f(e) \leq c(e) \\ &= c(A, B) \end{aligned}$$

# Proof of Max-Flow Min-Cut Theorem

(iii)  $\Rightarrow$  (i):

**Claim:** If there is no augmenting path w.r.t.  $f$ , there is a cut  $(A, B)$  s.t.  $v(f) = c(A, B)$ .

**Proof of Claim:** Let  $f$  be a flow with no augmenting paths.

Let  $A$  be the set of vertices reachable from  $s$  in residual graph  $G_f$ .

- By definition of  $A$ ,  $s \in A$ .
- Since no augmenting path ( $s$ - $t$  path in  $G_f$ ),  $t \notin A$ .

original network

residual graph

# Proof: Identifying the Min Cut

(iii)  $\Rightarrow$  (i):

**Claim:** If there is no augmenting path w.r.t.  $f$ , there is a cut  $(A, B)$  s.t.  $v(f) = c(A, B)$ .

**Proof of Claim:** Let  $f$  be a flow with no augmenting paths.

Let  $A$  be the set of vertices reachable from  $s$  in residual graph  $G_f$ .

- By definition of  $A$ ,  $s \in A$ .
- Since no augmenting path ( $s$ - $t$  path in  $G_f$ ),  $t \notin A$ .

Then

$$v(f) = \sum_{e \text{ out of } A} f(e) - \sum_{e \text{ into } A} f(e) \quad (\text{by Flow-Value Lemma})$$

original network

residual graph

# Identifying the Min Cut: No Inflow

(iii)  $\Rightarrow$  (i):

**Claim:** If there is no augmenting path w.r.t.  $f$ , there is a cut  $(A, B)$  s.t.  $v(f) = c(A, B)$ .

**Proof of Claim:** Let  $f$  be a flow with no augmenting paths.

Let  $A$  be the set of vertices reachable from  $s$  in residual graph  $G_f$ .

- By definition of  $A$ ,  $s \in A$ .
- Since no augmenting path ( $s$ - $t$  path in  $G_f$ ),  $t \notin A$ .

Then

$$v(f) = \sum_{e \text{ out of } A} f(e) - \sum_{e \text{ into } A} f(e)$$

$$= \sum_{e \text{ out of } A} f(e)$$

(By contradiction: If an edge going into  $A$  had flow then the backward edge would be in the residual graph, so the edge should not cross the cut)

original network

residual graph

# Identifying the Min Cut: Saturated Outflow

(iii)  $\Rightarrow$  (i):

**Claim:** If there is no augmenting path w.r.t.  $f$ , there is a cut  $(A, B)$  s.t.  $v(f) = c(A, B)$ .

**Proof of Claim:** Let  $f$  be a flow with no augmenting paths.

Let  $A$  be the set of vertices reachable from  $s$  in residual graph  $G_f$ .

- By definition of  $A$ ,  $s \in A$ .
- Since no augmenting path ( $s$ - $t$  path in  $G_f$ ),  $t \notin A$ .

Then

$$\begin{aligned}
 v(f) &= \sum_{e \text{ out of } A} f(e) - \sum_{e \text{ into } A} f(e) \\
 &= \sum_{e \text{ out of } A} f(e) \\
 &= \sum_{e \text{ out of } A} c(e)
 \end{aligned}$$

**(By contradiction:** If an edge going out of  $A$  had unused capacity then the forward edge would be in the residual graph, so the edge should not cross the cut)

“ $e$  is saturated”  
No unused capacity on  $e$   
 $f(e) = c(e)$

original network

$e^R$  can't exist because then  $y$  would be reachable from  $s$

residual graph

# Identifying the Min Cut: Conclusion

(iii)  $\Rightarrow$  (i):

**Claim:** If there is no augmenting path w.r.t.  $f$ , there is a cut  $(A, B)$  s.t.  $v(f) = c(A, B)$ .

**Proof of Claim:** Let  $f$  be a flow with no augmenting paths.

Let  $A$  be the set of vertices reachable from  $s$  in residual graph  $G_f$ .

- By definition of  $A$ ,  $s \in A$ .
- Since no augmenting path ( $s$ - $t$  path in  $G_f$ ),  $t \notin A$ .

Then

$$\begin{aligned} v(f) &= \sum_{e \text{ out of } A} f(e) - \sum_{e \text{ into } A} f(e) \\ &= \sum_{e \text{ out of } A} c(e) = c(A, B) \quad (\text{by Definition}) \end{aligned}$$

original network
