NP-completeness reductions

Spring 2007
Paul Beame

1

NP-hardness & NP-completeness

- Definition: A problem **B** is **NP-hard** iff every problem **A** \in **NP** satisfies $A \leq_p B$
- Definition: A problem **B** is **NP-complete** iff **B** is NP-hard and $B \in$ **NP**
- Even though we seem to have lots of hard problems in **NP** it is not obvious that such super-hard problems even exist!

2

P and NP

3

Reductions by Simple Equivalence

- Show: **Independent-Set** \leq_p **Clique**
- Independent-Set:**
 - Given a graph $G=(V,E)$ and an integer k , is there a subset U of V with $|U| \geq k$ such that no two vertices in U are joined by an edge.
- Clique:**
 - Given a graph $G=(V,E)$ and an integer k , is there a subset U of V with $|U| \geq k$ such that every pair of vertices in U is joined by an edge.

4

Independent-Set \leq_p Clique

- Given $\langle G,k \rangle$ as input to **Independent-Set** where $G=(V,E)$
- Transform to $\langle G',k \rangle$ where $G'=(V,E')$ has the same vertices as G but E' consists of **precisely** those edges that are **not** edges of G
- U is an independent set in G
- $\Leftrightarrow U$ is a clique in G'

5

Satisfiability

- Boolean variables x_1, \dots, x_n
 - taking values in $\{0,1\}$. 0=false, 1=true
- Literals
 - x_i or $\neg x_i$ for $i=1, \dots, n$
- Clause
 - a logical OR of one or more literals
 - e.g. $(x_1 \vee \neg x_3 \vee x_7 \vee x_{12})$
- CNF formula
 - a logical AND of a bunch of clauses

6

Satisfiability

- CNF formula example
 - $(x_1 \vee \neg x_3 \vee x_7 \vee x_{12}) \wedge (x_2 \vee \neg x_4 \vee x_7 \vee x_5)$
 - If there is some assignment of 0's and 1's to the variables that makes it true then we say the formula is **satisfiable**
 - the one above is, the following isn't
 - $x_1 \wedge (\neg x_1 \vee x_2) \wedge (\neg x_2 \vee x_3) \wedge \neg x_3$
 - SAT**: Given a formula F , is it satisfiable?

7

Cook-Levin Theorem

- Theorem (Cook-Levin 1971):**
 $SAT \in P \Leftrightarrow P = NP$
- Follows by showing that **SAT** is **NP-complete**

8

Recall this useful property of polynomial-time reductions

- Theorem:** If $A \leq_p B$ and $B \leq_p C$ then $A \leq_p C$

9

Cook-Levin Theorem & Implications

- Theorem:** **SAT** is **NP-complete**
 - Corollary:** C is **NP-hard** $\Leftrightarrow SAT \leq_p C$
 - (or $B \leq_p C$ for any **NP-complete** problem B)
 - Proof:**
 - If B is **NP-hard** then every problem in **NP** polynomial-time reduces to B , in particular **SAT** does since it is in **NP**
 - For any problem A in **NP**, $A \leq_p SAT$ and so if $SAT \leq_p C$ we have $A \leq_p C$.
 - therefore C is **NP-hard** if $SAT \leq_p C$

10

Steps to Proving Problem B is NP-complete

- Show B is **NP-hard**:
 - State: Reduction is from **NP-hard** Problem A
 - Show what the map f is
 - Argue that f is polynomial time
 - Argue correctness: **two directions** Yes for A implies Yes for B and vice versa.
 - Show B is in **NP**
 - State what certificate is and why it works
 - Argue that it is polynomial-time to check.

11

Another NP-complete problem: Satisfiability \leq_p Independent-Set

- A Tricky Reduction:
 - mapping CNF formula F to a pair $\langle G, k \rangle$
 - Let m be the number of clauses of F
 - Create a vertex in G for each literal in F
 - Join two vertices u, v in G by an edge iff
 - u and v correspond to literals in the same clause of F , (**green edges**) or
 - u and v correspond to literals x and $\neg x$ (or vice versa) for some variable x . (**red edges**).
 - Set $k=m$
 - Clearly polynomial-time**

12

Satisfiability \leq^p Independent-Set

F: $(x_1 \vee \neg x_3 \vee x_4) \wedge (x_2 \vee \neg x_4 \vee x_3) \wedge (x_2 \vee \neg x_1 \vee x_3)$

13

Satisfiability \leq^p Independent-Set

Correctness:

- If F is **satisfiable** then there is some assignment that satisfies at least one literal in each clause.
- Consider the set U in G corresponding to the **first satisfied literal in each clause**.
 - $|U|=m$
 - Since U has only one vertex per clause, no two vertices in U are joined by **green edges**
 - Since a truth assignment never satisfies both x and $\neg x$, U doesn't contain vertices labeled both x and $\neg x$ and so no vertices in U are joined by **red edges**
 - Therefore G has an independent set, U, of size at least m
- Therefore (G,m) is a **YES** for independent set.

14

Satisfiability \leq^p Independent-Set

F: $(x_1 \vee \neg x_3 \vee x_4) \wedge (x_2 \vee \neg x_4 \vee x_3) \wedge (x_2 \vee \neg x_1 \vee x_3)$

1 0 1 1 0 1 1 0 1

U

Given assignment $x_1=x_2=x_3=x_4=1$, U is as circled

15

Satisfiability \leq^p Independent-Set

Correctness continued:

- If (G,m) is a **YES** for **Independent-Set** then there is a set U of m vertices in G containing no edge.
- Therefore U has precisely one vertex per clause because of the **green edges** in G.
- Because of the **red edges** in G, U does not contain vertices labeled both x and $\neg x$
- Build a truth assignment A that makes all literals labeling vertices in U true and for any variable not labeling a vertex in U, assigns its truth value arbitrarily.
- By construction, A satisfies F
- Therefore F is a **YES** for **Satisfiability**.

16

Satisfiability \leq^p Independent-Set

F: $(x_1 \vee \neg x_3 \vee x_4) \wedge (x_2 \vee \neg x_4 \vee x_3) \wedge (x_2 \vee \neg x_1 \vee x_3)$

0 1 0 ? 1 0 ? 1 0

U

Given U, satisfying assignment is $x_1=x_3=x_4=0, x_2=0$ or 1

17

Independent-Set is NP-complete

- We just showed that **Independent-Set** is **NP-hard** and we already knew **Independent-Set** is in **NP**.
- Corollary:** **Clique** is **NP-complete**
- We showed already that **Independent-Set** \leq_p **Clique** and **Clique** is in **NP**.

18

Reductions from a Special Case to a General Case

- Show: **Vertex-Cover** \leq_p **Set-Cover**
- Vertex-Cover:**
 - Given an undirected graph $G=(V,E)$ and an integer k is there a subset W of V of size at most k such that every edge of G has at least one endpoint in W ? (i.e. W covers all edges of G).
- Set-Cover:**
 - Given a set U of n elements, a collection S_1, \dots, S_m of subsets of U , and an integer k , does there exist a collection of at most k sets whose union is equal to U ?

19

The Simple Reduction

- Transformation f maps $\langle G=(V,E), k \rangle$ to $\langle U, S_1, \dots, S_m, k' \rangle$
 - $U \leftarrow E$
 - For each vertex $v \in V$ create a set S_v containing all edges that touch v
 - $k' \leftarrow k$
- Reduction f is clearly polynomial-time to compute
- We need to prove that the resulting algorithm gives the right answer.

20

Proof of Correctness

- Two directions:
 - If the answer to **Vertex-Cover** on $\langle G, k \rangle$ is YES then the answer for **Set-Cover** on $\langle T(G, k), k \rangle$ is YES
 - If a set W of k vertices covers all edges then the collection $\{S_v \mid v \in W\}$ of k sets covers all of U
 - If the answer to **Set-Cover** on $\langle T(G, k), k \rangle$ is YES then the answer for **Vertex-Cover** on $\langle G, k \rangle$ is YES
 - If a subcollection S_{v_1}, \dots, S_{v_k} covers all of U then the set $\{v_1, \dots, v_k\}$ is a vertex cover in G .

21

More Reductions

- Show: **Independent Set** \leq_p **Vertex-Cover**
- Vertex-Cover:**
 - Given an undirected graph $G=(V,E)$ and an integer k is there a subset W of V of size at most k such that every edge of G has at least one endpoint in W ? (i.e. W covers all edges of G).
- Independent-Set:**
 - Given a graph $G=(V,E)$ and an integer k , is there a subset U of V with $|U| \geq k$ such that **no two** vertices in U are joined by an edge.

22

Reduction Idea

- Claim:** In a graph $G=(V,E)$, S is an independent set iff $V-S$ is a vertex cover
- Proof:**
 - \Rightarrow Let S be an independent set in G
 - Then S contains at most one endpoint of each edge of G
 - At least one endpoint must be in $V-S$
 - $V-S$ is a vertex cover
 - \Leftarrow Let $W=V-S$ be a vertex cover of G
 - Then S does not contain both endpoints of any edge (else W would miss that edge)
 - S is an independent set

23

Reduction

- Map $\langle G, k \rangle$ to $\langle G, n-k \rangle$
 - Previous lemma proves correctness
- Clearly polynomial time
- We also get that
 - Vertex-Cover** \leq_p **Independent Set**

24

Problems we already know are NP-complete

- Satisfiability
 - Independent-Set
 - Clique
 - Vertex-Cover
- There are 1000's of practical problems that are NP-complete, e.g. scheduling, optimal VLSI layout etc.

25

A particularly useful problem for proving NP-completeness

- 3-SAT:** Given a CNF formula **F** having precisely 3 variables per clause (i.e., in 3-CNF), is **F** satisfiable?
- Theorem:** 3-SAT is NP-complete
- Alternate Proof based on CNFSAT:**
 - 3-SAT ∈ NP**
 - Certificate is a satisfying assignment
 - Just like SAT it is polynomial-time to check the certificate

26

CNFSAT \leq_p 3-SAT

- Reduction:
 - map CNF formula **F** to another CNF formula **G** that has precisely 3 variables per clause.
 - G** has one or more clauses for each clause of **F**
 - G** will have extra variables that don't appear in **F**
 - for each clause **C** of **F** there will be a different set of variables that are used only in the clauses of **G** that correspond to **C**

27

CNFSAT \leq_p 3-SAT

- Goal:
 - An assignment **a** to the original variables makes clause **C** true in **F** iff
 - there is an assignment to the extra variables that together with the assignment **a** will make all new clauses corresponding to **C** true.
 - Define the reduction clause-by-clause
 - We'll use variable names **z_i** to denote the extra variables related to a single clause **C** to simplify notation
 - in reality, two different original clauses will not share **z_i**

28

CNFSAT \leq_p 3-SAT

- For each clause **C** in **F**:
 - If **C** has 3 variables:
 - Put **C** in **G** as is
 - If **C** has 2 variables, e.g. $C=(x_1 \vee \neg x_3)$
 - Use a new variable **z** and put two clauses in **G**

$$(x_1 \vee \neg x_3 \vee z) \wedge (x_1 \vee \neg x_3 \vee \neg z)$$
 - If original **C** is true under assignment **a** then both new clauses will be true under **a**
 - If new clauses are both true under some assignment **b** then the value of **z** doesn't help in one of the two clauses so **C** must be true under **b**

29

CNFSAT \leq_p 3-SAT

- If **C** has 1 variable: e.g. $C=x_1$
 - Use two new variables **z₁**, **z₂** and put 4 new clauses in **G**

$$(x_1 \vee \neg z_1 \vee \neg z_2) \wedge (x_1 \vee \neg z_1 \vee z_2) \wedge (x_1 \vee z_1 \vee \neg z_2) \wedge (x_1 \vee z_1 \vee z_2)$$
 - If original **C** is true under assignment **a** then all new clauses will be true under **a**
 - If new clauses are all true under some assignment **b** then the values of **z₁** and **z₂** don't help in one of the 4 clauses so **C** must be true under **b**

30

CNFSAT \leq_p 3-SAT

- If C has $k \geq 4$ variables: e.g. $C=(x_1 \vee \dots \vee x_k)$
 - Use $k-3$ new variables z_2, \dots, z_{k-2} and put $k-2$ new clauses in G

$$(x_1 \vee x_2 \vee z_2) \wedge (\neg z_2 \vee x_3 \vee z_3) \wedge (\neg z_3 \vee x_4 \vee z_4) \wedge \dots \wedge (\neg z_{k-3} \vee x_{k-2} \vee z_{k-2}) \wedge (\neg z_{k-2} \vee x_{k-1} \vee x_k)$$
 - If original C is true under assignment a then some x_i is true for $i \leq k$. By setting z_j true for all $j < i$ and false for all $j \geq i$, we can extend a to make all new clauses true.
 - If new clauses are all true under some assignment b then some x_i must be true for $i \leq k$ because $z_2 \wedge (\neg z_2 \vee z_3) \wedge \dots \wedge (\neg z_{k-3} \vee z_{k-2}) \wedge \neg z_{k-2}$ is not satisfiable

31

Graph Colorability

- Defn:** Given a graph $G=(V,E)$, and an integer k , a k -coloring of G is
 - an assignment of up to k different colors to the vertices of G so that the endpoints of each edge have different colors.
- 3-Color:** Given a graph $G=(V,E)$, does G have a 3-coloring?
- Claim:** 3-Color is NP-complete
- Proof:** 3-Color is in NP:
 - Hint is an assignment of red, green, blue to the vertices of G
 - Easy to check that each edge is colored correctly

32

3-SAT \leq_p 3-Color

- Reduction:**
 - We want to map a 3-CNF formula $\langle F \rangle$ to a graph $\langle G \rangle$ so that
 - G is 3-colorable iff F is satisfiable

33

3-SAT \leq_p 3-Color

Base Triangle

34

3-SAT \leq_p 3-Color

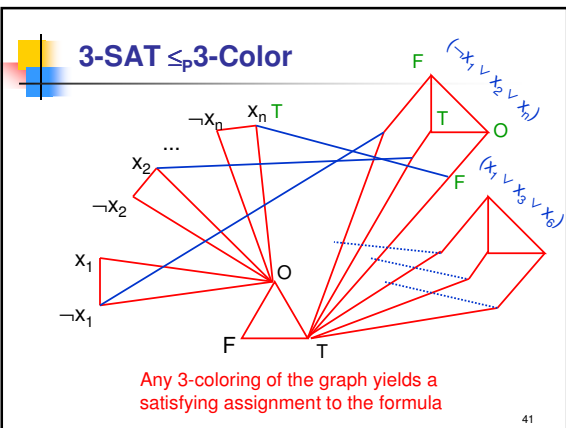

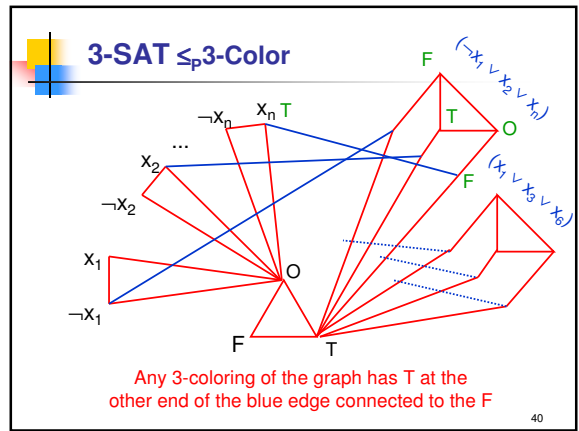

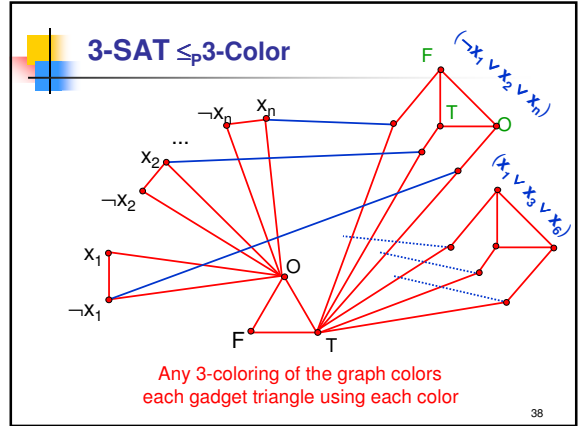

Variable Part:
in 3-coloring, variable colors correspond to some truth assignment (same color as T or F)

35

3-SAT \leq_p 3-Color

Clause Part:
Add one 6 vertex gadget per clause connecting its 'outer vertices' to the literals in the clause

36

More NP-completeness

- n **Subset-Sum problem**
 - n Given **n** integers w_1, \dots, w_n and integer **W**
 - n Is there a subset of the **n** input integers that adds up to exactly **W**?
- n **$O(nW)$** solution from dynamic programming but if **W** and each w_i can be **n** bits long then this is exponential time

42

3-SAT \leq_p Subset-Sum

- Given a 3-CNF formula with m clauses and n variables
- Will create $2m+2n$ numbers that are $m+n$ digits long
 - Two numbers for each variable x_i
 - t_i and f_i (corresponding to x_i being true or x_i being false)
 - Two extra numbers for each clause
 - u_j and v_j (filler variables to handle number of false literals in clause C_j)

43

3-SAT \leq_p Subset-Sum

	i			j									
	1	2	3	4	...	n	1	2	3	4	...	m	
t_1	1	0	0	0	...	0	0	0	1	0	...	1	
f_1	1	0	0	0	...	0	1	0	0	1	...	0	
t_2	0	1	0	0	...	0	0	1	0	0	...	1	
f_2	0	1	0	0	...	0	0	0	1	1	...	0	
							
$u_1=v_1$	0	0	0	0	...	0	1	0	0	0	...	0	
$u_2=v_2$	0	0	0	0	...	0	0	1	0	0	...	0	
							
W	1	1	1	1	...	1	3	3	3	3	...	3	

$C_j = (x_1 \vee \neg x_2 \vee x_3)$

44
