CSE440: Introduction to HCI

Methods for Design, Prototyping and Evaluating User Interaction

Lecture 04: Design of Everyday Things Nigini Oliveira Manaswi Saha Liang He Jian Li Zheng Jeremy Viny

What we will do today

It is never a user's fault!

<u>99% Invisible Post</u>. (Just read and listen everything there!) =)

What is Interaction?

Two-Way

One-way is reaction

Communicative

Information is sent

Receptive

Information is received

Effective

There are changes as a result

Buxton's 3-State Model

Buxton's 3-State Model

Buxton's 3-State Model

Norman's Execution-Evaluation Cycle

1.Establish the goal Increase light in the room
2.Form the intention To turn on the lamp
3.Specify the action sequence Walk to the lamp, reach for the knob, twist the knob
4.Execute the action sequence [walk, reach, twist]
5.Perceive the system state [hear "click" sound, see light from lamp]
6.Interpret the system state The knob rotated. The lamp is emitting light. The lamp seems to work
7.Evaluate the system state with respect to the goals and intentions The lamp did indeed increase the light in the room [goal satisfied] [REPEAT!]

Norman's Execution-Evaluation Cycle

Norman's Execution-Evaluation Cycle

Norman's Execution-Evaluation Cycle

What factors can extend the Gulfs in the example of increasing light in the room?

Gulf of Execution: An Example

Design principles help us answer these questions

Affordances Constraints Feedback Consistency Metaphors Mappings Visibility

Design principles help us answer these questions

Affordances

Constraints Feedback Consistency Metaphors Mappings

Visibility

Perceived Action Possibilities

What does this chair afford?

Technology affordances are often based in affordances from the physical world

"Real-world" example: Knurling

"In general, when the apparent affordances of an artifact matches its intended use, the artifact is easy to operate. When apparent affordances suggest different actions than those for which the object is designed, errors are common."

Gaver

False affordances

False affordances

Hidden affordances

When there is no perceptual information suggesting an actual intended use

Hidden affordances

Logos linking to home is a convention, but not afforded by the page

Clarification on Convention

"Designers sometimes will say that when they put an icon, cursor, or other target on the screen, they have added an 'affordance' to the system. This is a misuse of the concept. ... It is wrong to claim that the design of a graphical object on the screen 'affords clicking.' ... Yes, the object provides a target and it helps the user know where to click and maybe even what to expect in return, but those aren't affordances, those are conventions, and feedback, and the like. ... Don't confuse affordances with conventions." Norman

Affordances vs Signifiers

Affordances are the possible interactions between people and the environment. (It is not a property of the "thing"!)

Perceived affordances often act as signifiers, but they can be ambiguous.

Signifiers signal things, in particular what actions are possible and how they should be done. Signifiers must be perceivable, else they fail to function.

Norman

Design principles

Affordances **Constraints** Feedback Consistency Metaphors Mappings Visibility

Constraints

Prevent some actions while allowing others

Prevent errors before they can happen

Disruptive error messages are a last resort

Constraints

Design principles

Affordances Constraints **Feedback** Consistency Metaphors Mappings Visibility

Feedback

LOADING...

Feedback

All actions have to be confirmed

Must be immediate

Must be informative

Preferably non-distracting and unobtrusive

Design principles

Affordances Constraints Feedback **Consistency** Metaphors Mappings Visibility

Consistency

Interfaces should be consistent in meaningful ways

Ubiquitous use of same keys for cut/copy/ paste

Types of consistency

Internal (i.e., within itself)

e.g., same terminology and layout throughout

External (i.e., with other applications)

e.g., common widget appearance

e.g., design patterns common across applications

Is consistency always better?

Design principles

Affordances Constraints Feedback Consistency **Metaphors** Mappings Visibility

Metaphors

Suggest an existing mental model

"horseless carriages", "wireless"

Desktop metaphor

Not an attempt to simulate a real desktop Leverages knowledge of files, folders, trash Explains why some windows seem hidden

Example: Mail Metaphor

Example: Health Metaphor

Broken Metaphors

Are not consistent, do not operate in every circumstance, or do not uphold things consistent with what the metaphor would suggest

Dead Metaphors

Lost the original imagery of their meaning

Design principles

Affordances Constraints Feedback Consistency Metaphors **Mappings** Visibility

Correspondence between an interface and the corresponding action in 'the world'

Minimize cognitive steps to transform action into effect, or perception into comprehension (i.e., execution and evaluation)

Removing the cover plate, then removing and swapping the switches.

From http://fivesketches.com/2009/11/natural-mapping-of-switches/

Design principles

Affordances Constraints Feedback Consistency Metaphors Mappings **Visibility**

Visibility

Visibility

Visibility

Differentiate opposing functionality

Use visual function to confirm the user's mental model of operation

Sometimes sound can be used to make things 'visible' (e.g. vacuum cleaner clogging up)

Just the right things have to be visible: excess is as bad as lack of visible clues

Summary

Summary: Features of Good Design

Has affordances (makes each operation visible)

Offers obvious **mappings** (makes the relationship between the actual action of the device and the action of the user obvious)

Provides **feedback** on the user's action

Provides a good **mental model** of the underlying behavior of the device

Provides constraints (to prevent errors)

Bad Design Hunt

Can you discover instances of bad design on campus?

False affordances? A lack of consistency, visibility, or mappings?

"Thanks to you, I now constantly notice how badly things are designed." — anonymous student from the Spring 2017 offering

Ask me something!
