

CSE 442 - Data Visualization

Color

Jeffrey Heer [University of Washington](#)

Purpose of Color

To label

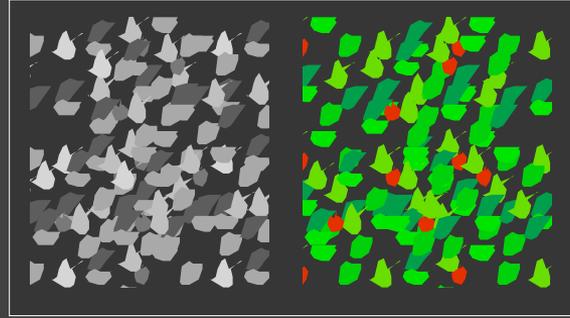

To measure

To represent and imitate

To enliven and decorate

"Above all, do no harm."

- Edward Tufte

Color Topics

Perception of Color

Light, Visual system, Mental models

Color in Information Visualization

Categorical & Quantitative encoding

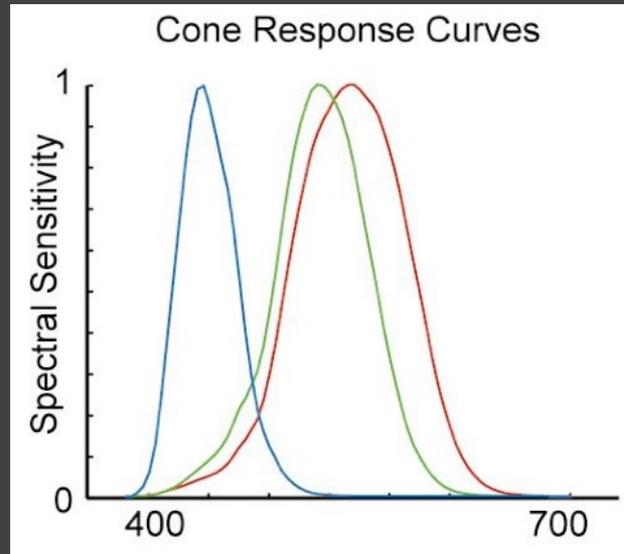

Guidelines for color palette design

Perception of Color

As light enters our retina...

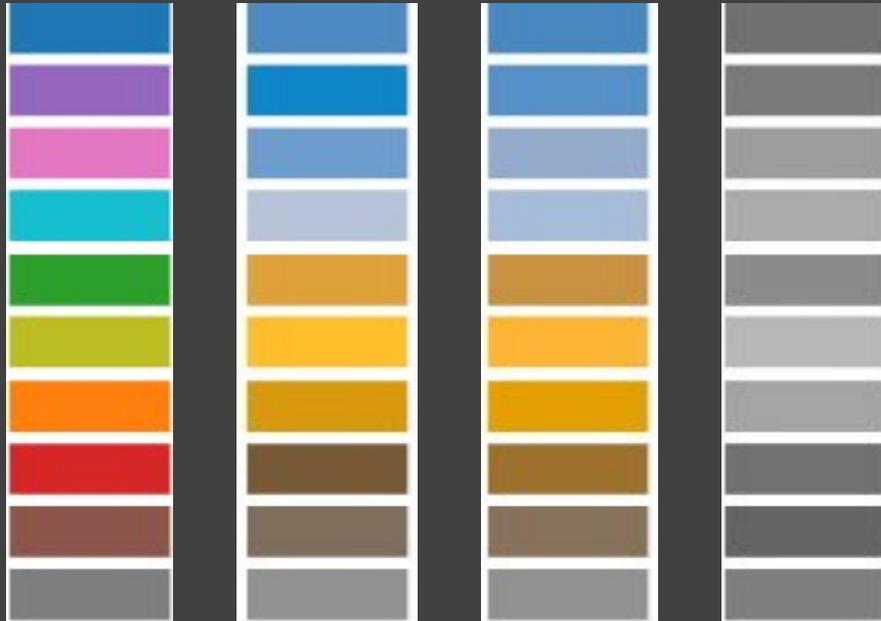

LMS (Long, Middle, Short) Cones

Sensitive to different wavelengths

Color Vision Deficiency (CVD)

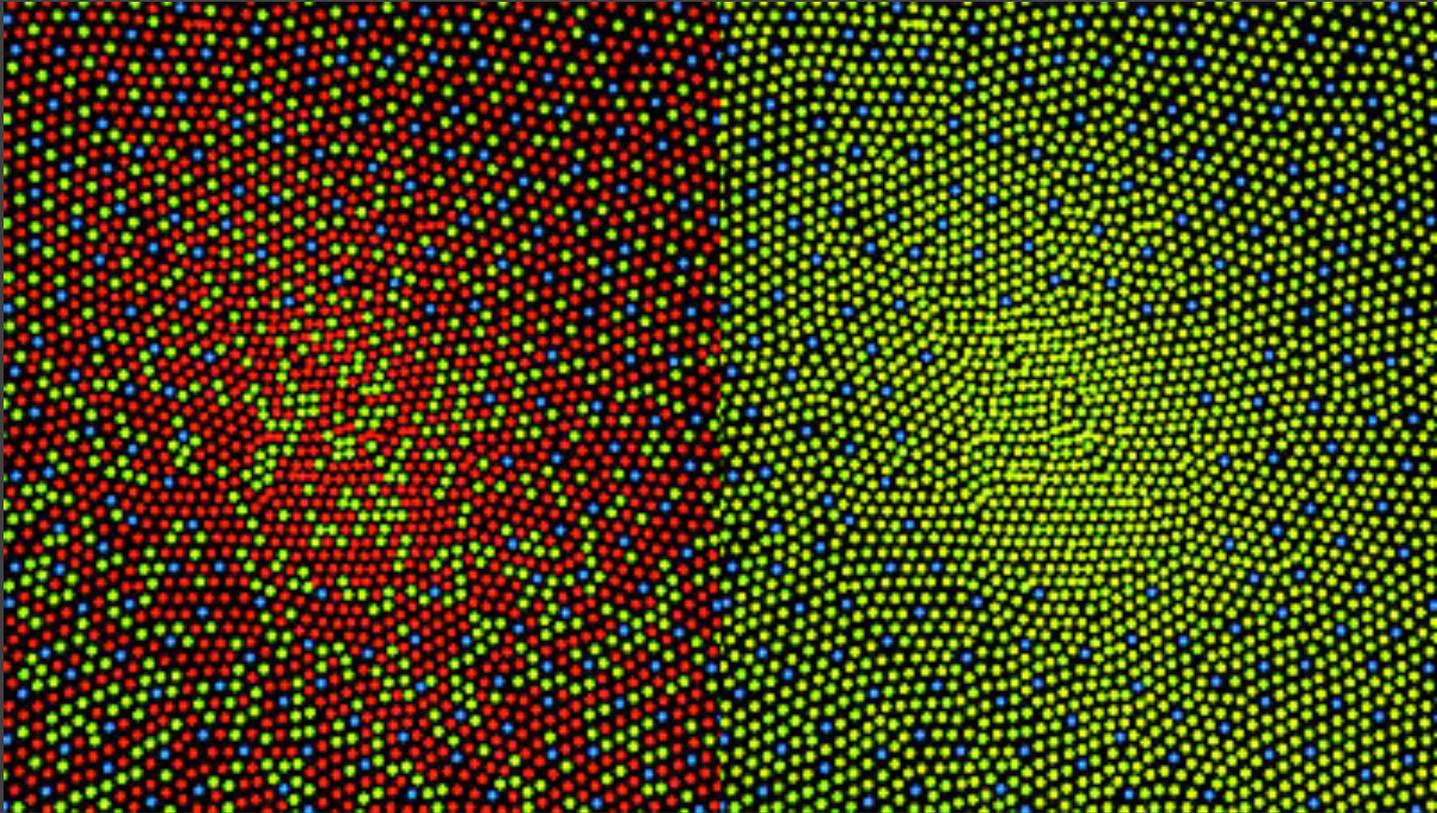

Missing one or more cones or rods in retina.

Protanope

Deuteranope

Luminance

Normal Retina

Protanopia

Color Vision Simulators

Simulate color vision deficiencies

Browser plug-ins

Photoshop plug-ins, etc.

Deuteranope

Protanope

Tritanope

Primary Colors

To paint "all colors":

Leonardo da Vinci, circa 1500 described in his notebooks a list of simple colors...

Yellow

Blue

Green

Red

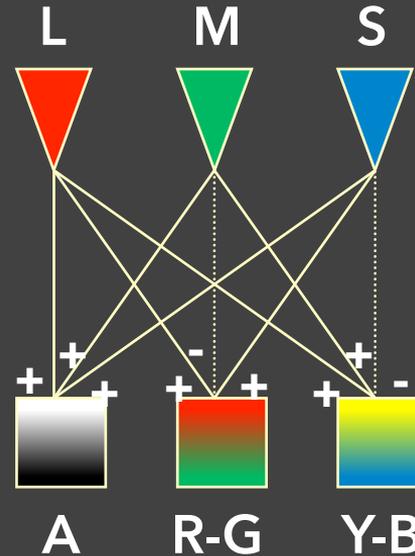

Opponent Processing

LMS are combined to create:

Lightness

Red-green contrast

Yellow-blue contrast

[Fairchild]

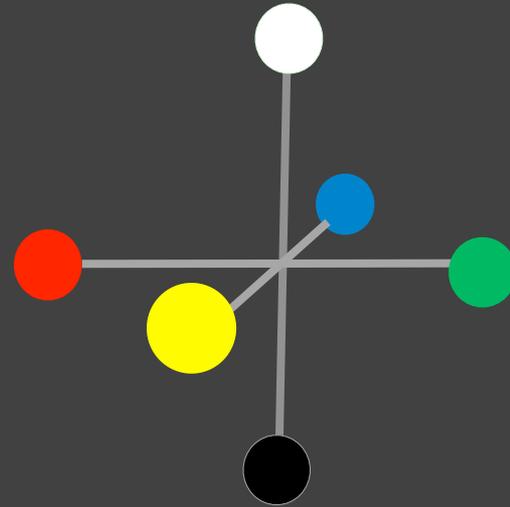

Opponent Processing

LMS are combined to create:

Lightness

Red-green contrast

Yellow-blue contrast

Opponent Processing

LMS are combined to create:

Lightness

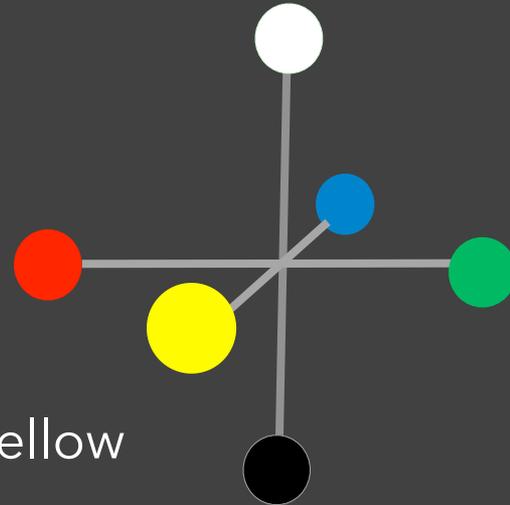

Red-green contrast

Yellow-blue contrast

Experiments:

No reddish-green, no blueish-yellow

Color after images

CIE LAB Color Space

Axes correspond to opponent signals

L* = Luminance

a* = Red-green contrast

b* = Yellow-blue contrast

Much more perceptually uniform than sRGB!

Scaling of axes to represent "color distance"

JND = Just noticeable difference (~2.3 units)

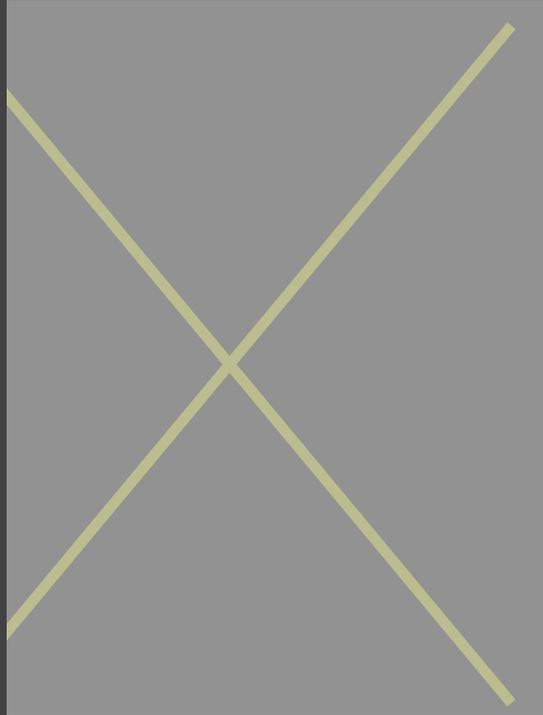

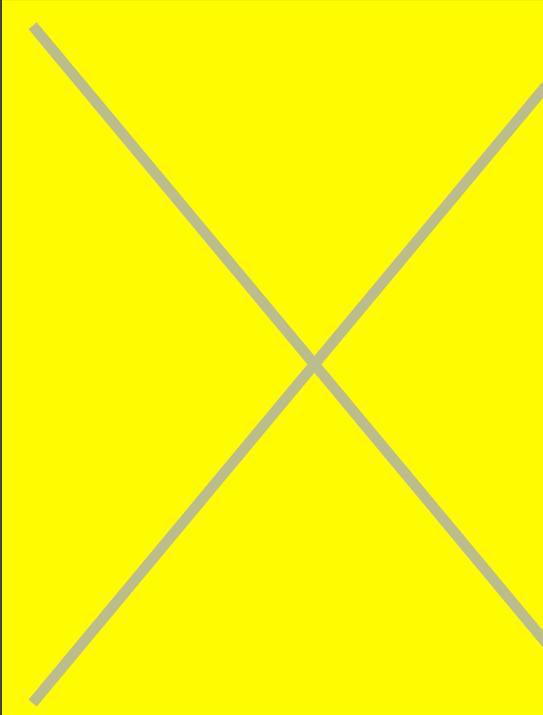

D3 + Vega include LAB color space support!

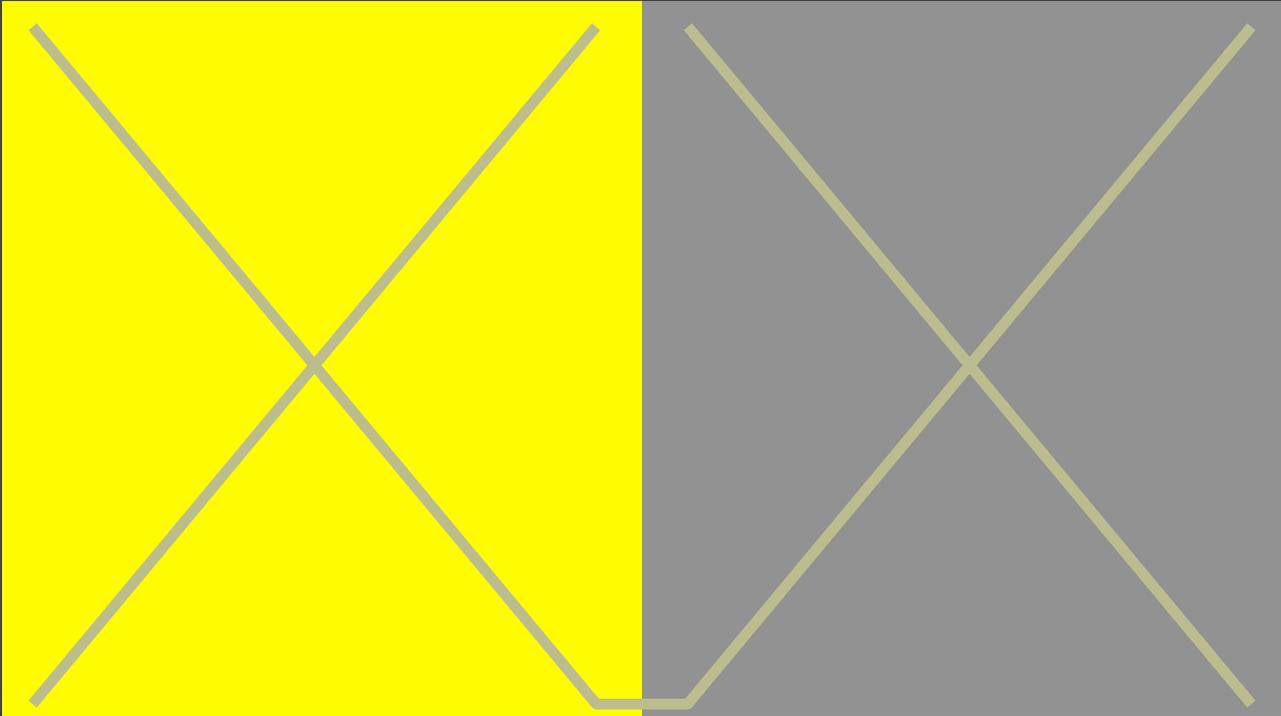

Color Appearance

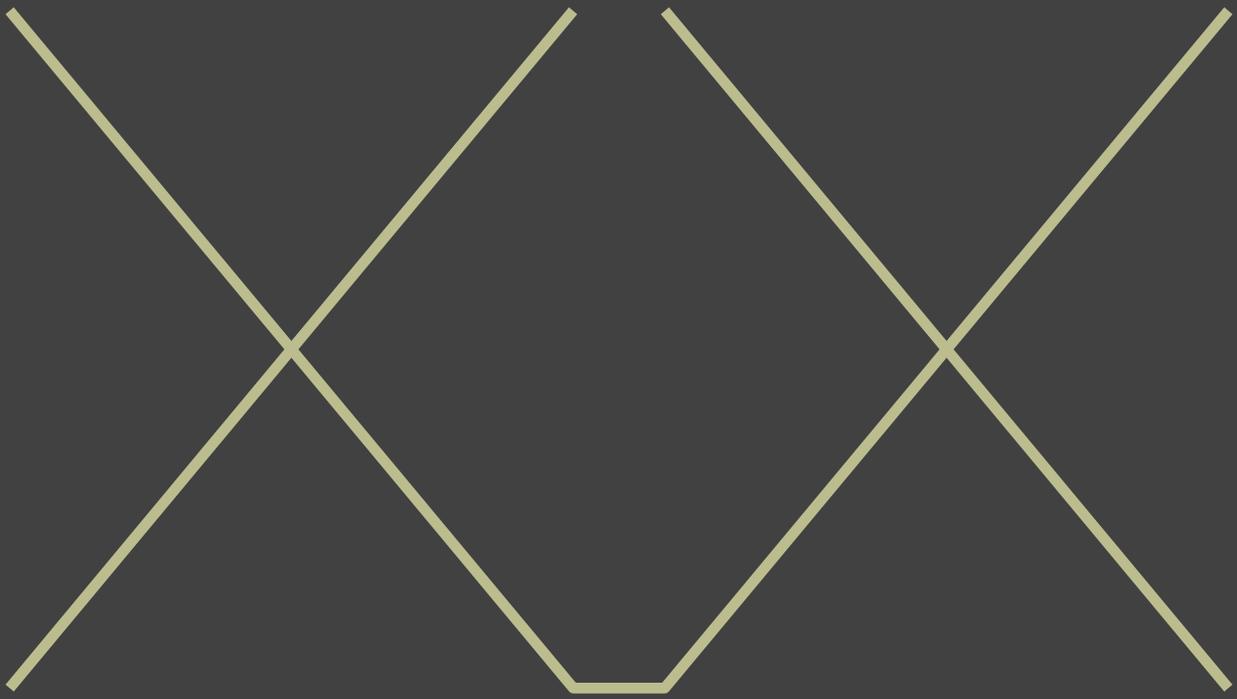

If we have a perceptually-uniform color space, can we predict how we perceive colors?

“In order to use color effectively it is necessary to recognize that it deceives continually.”

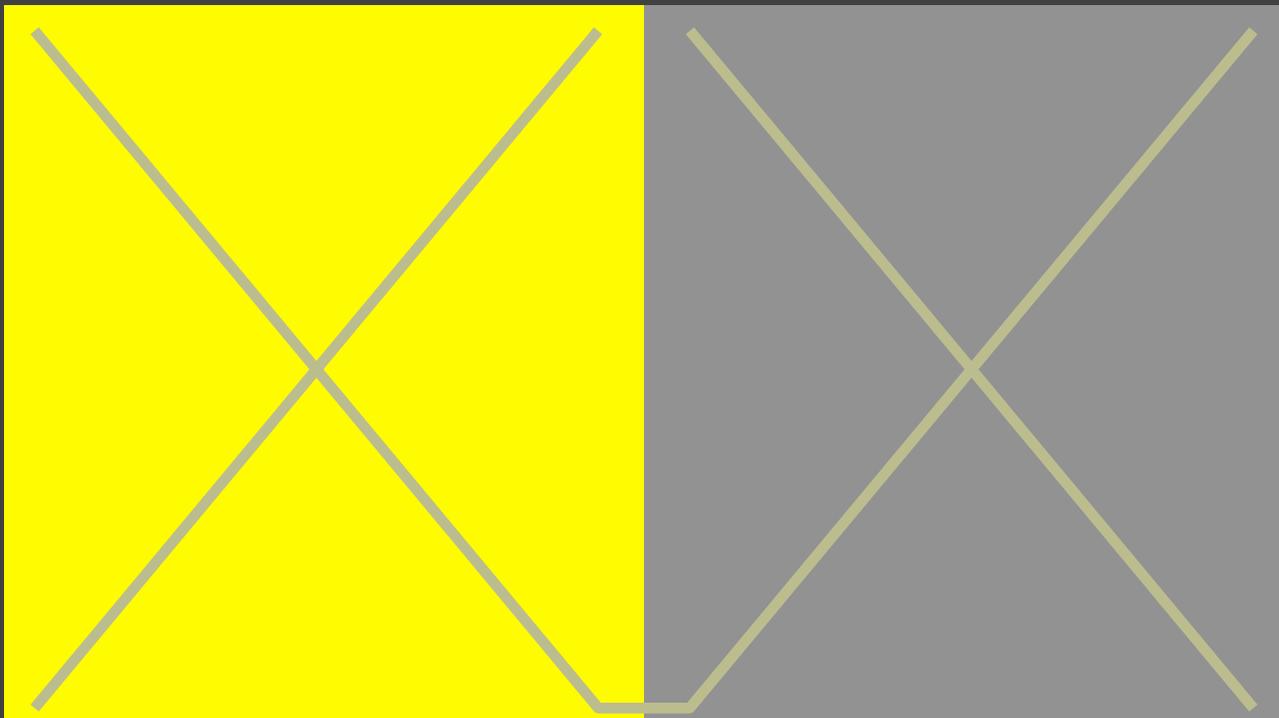

- Josef Albers, *Interaction of Color*

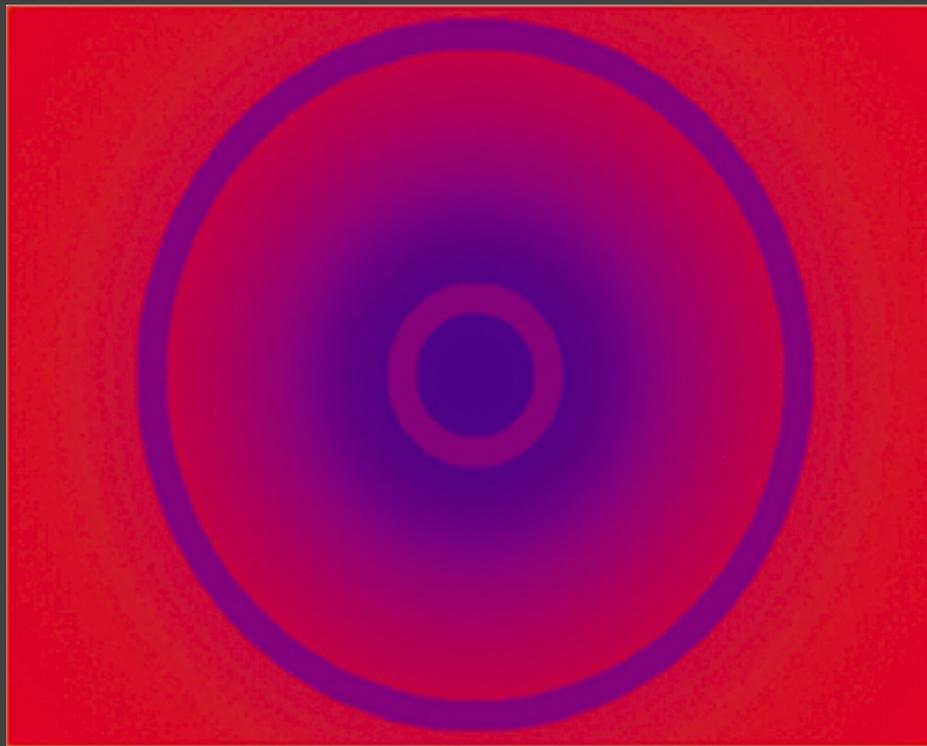

Simultaneous Contrast

Josef Albers

Simultaneous Contrast

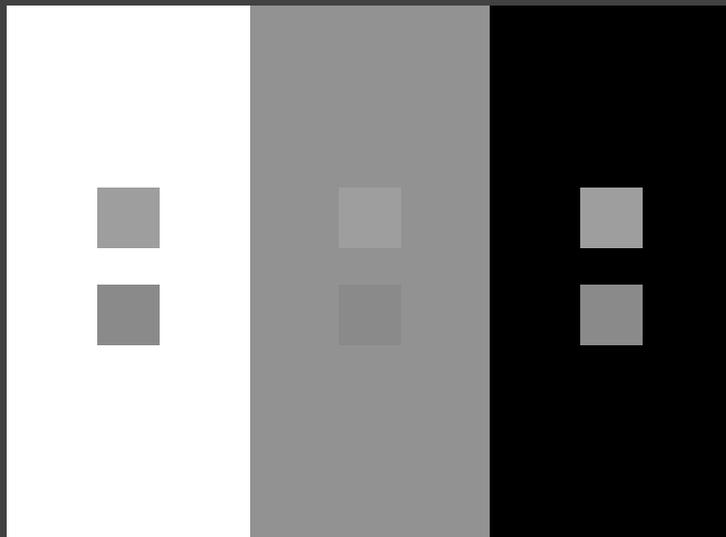

Inner & outer rings are the same physical purple.

Donald
MacLeod

Crispening

Perceived difference depends on background

Color Appearance Models, Fairchild

Designing Colormaps

Colormap Design Considerations

Perceptually distinguishable colors

Value distance matches perceptual distance

Colors and concepts properly align

Aesthetically pleasing, intriguing

Respect color vision deficiencies

Should survive printing to black & white

Don't overwhelm people's capability!

Discrete (Binary, Categorical)

Symbol Legend

Continuous (Sequential, Diverging, Cyclic)

Gradient Legend

Discretized Continuous

Discrete Gradient

Categorical Color

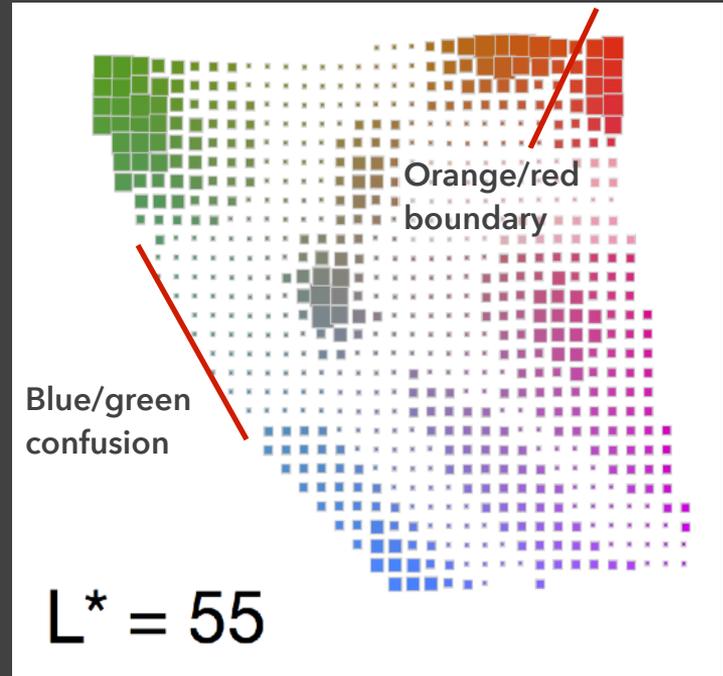

Color Naming Models [Heer & Stone '12]

Model 3 million responses from XKCD survey

Bins in LAB space
sized by *saliency*:

How much do people
agree on color name?

Modeled by entropy
of $p(\textit{name} \mid \textit{color})$

Palette Design & Color Names

Minimize overlap and ambiguity of colors.

Color Name Distance										Saliency	Name
0.00	1.00	1.00	1.00	0.98	1.00	1.00	1.00	1.00	0.20	.47	blue 62.9%
1.00	0.00	1.00	0.97	1.00	1.00	1.00	1.00	0.96	1.00	.90	orange 93.9%
1.00	1.00	0.00	1.00	1.00	1.00	1.00	1.00	0.90	0.99	.67	green 79.8%

Excel-10										<i>Average</i> 0.87	.27

Quantitative Color

Rainbow Color Maps

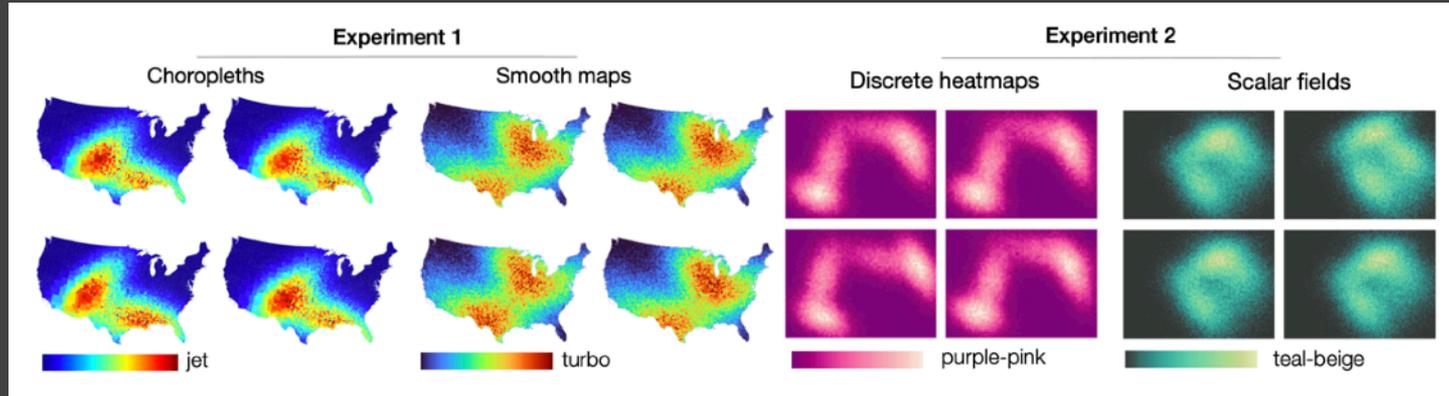

Be wary of naïve rainbows?

1. Naive rainbows are unfriendly to color blind viewers
2. Hues are not naturally ordered
3. Some colors are less effective at high spatial frequencies
4. People segment colors into classes -> perceptual banding

But rainbow helpful for inference?

Reda et al. '21: Color Nameability Predicts Inference Accuracy in Spatial Visualizations

Rainbow found ineffective for *value comparison* [Liu '18]...

...but color name salience found to improve performance on *inference task* of distinguishing distributions [Reda '21]

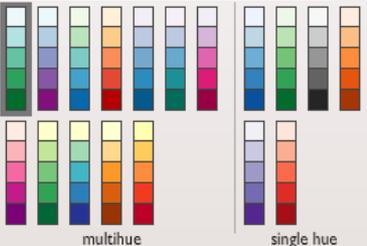

Task matters!

Steps, rather than Gradients?

SCORE CARD

Classing Quantitative Data

Age-adjusted	
(U.S. rate = 205.0)	
Rate per 100,000 population	Comparative mortality ratio (HSA to U.S.)
253.8 - 328.6	1.24 - 1.60
236.8 - 253.7	1.16 - 1.24
215.2 - 236.7	1.05 - 1.16
199.9 - 215.1	0.98 - 1.05
179.5 - 199.8	0.88 - 0.98
166.7 - 179.4	0.81 - 0.88
112.4 - 166.6	0.55 - 0.81

Age-adjusted mortality rates for the United States.
Common option: break into 5 or 7 quantiles.

Classing Quantitative Data

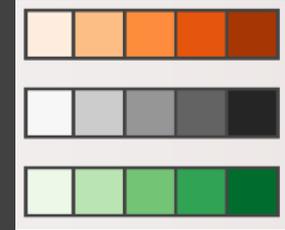

1. Equal interval (arithmetic progression)
2. Quantiles (***recommended***)
3. Standard deviations
4. Clustering (Jenks' natural breaks / 1D K-Means)
 - Minimize within group variance
 - Maximize between group variance

Quantitative Color Encoding

Sequential color scale

Ramp in luminance, possibly also hue

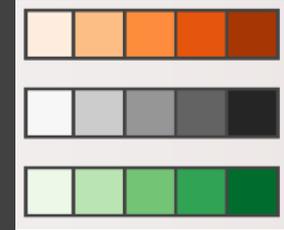

Higher value -> darker color (or vice versa)

Quantitative Color Encoding

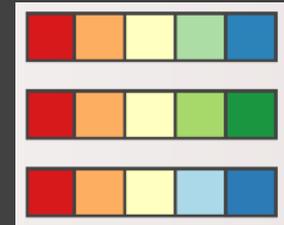

Sequential color scale

Ramp in luminance, possibly also hue
Higher value -> darker color (or vice versa)

Diverging color scale

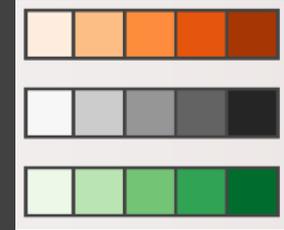

Useful when data has meaningful "midpoint"
Use neutral color (e.g., grey) for midpoint
Use saturated colors for endpoints

Quantitative Color Encoding

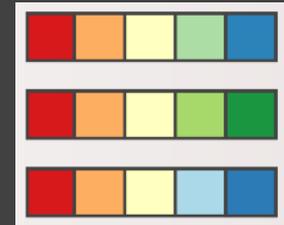

Sequential color scale

Ramp in luminance, possibly also hue
Higher value -> darker color (or vice versa)

Diverging color scale

Useful when data has meaningful "midpoint"
Use neutral color (e.g., grey) for midpoint
Use saturated colors for endpoints

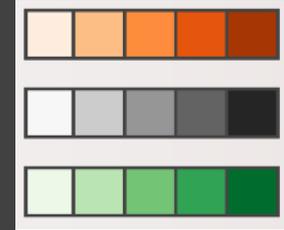

Limit number of steps in color to 3-9

Why?

Quantitative Color Encoding

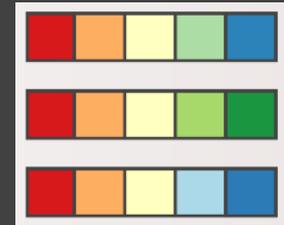

Sequential color scale

Ramp in luminance, possibly also hue
Higher value -> darker color (or vice versa)

Diverging color scale

Useful when data has meaningful "midpoint"
Use neutral color (e.g., grey) for midpoint
Use saturated colors for endpoints

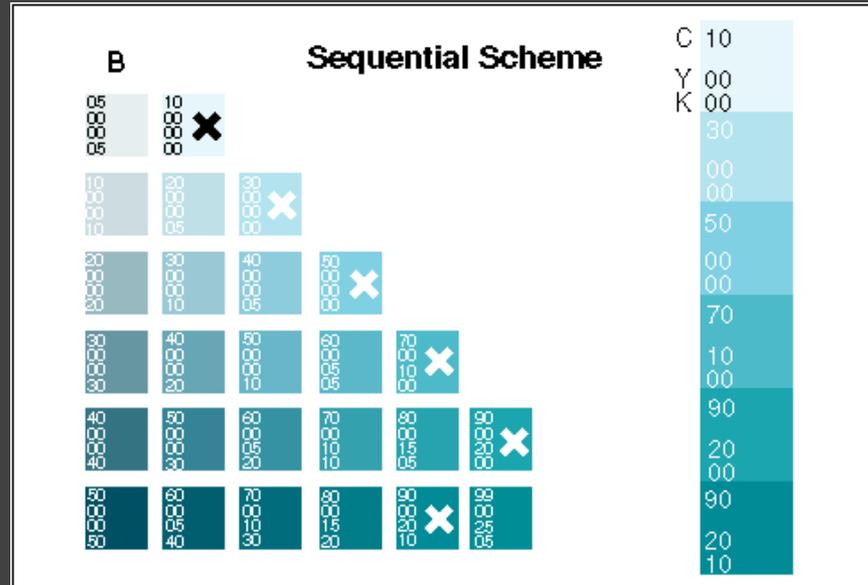

Limit number of steps in color to 3-9

Avoid simultaneous contrast, hold mappings in memory

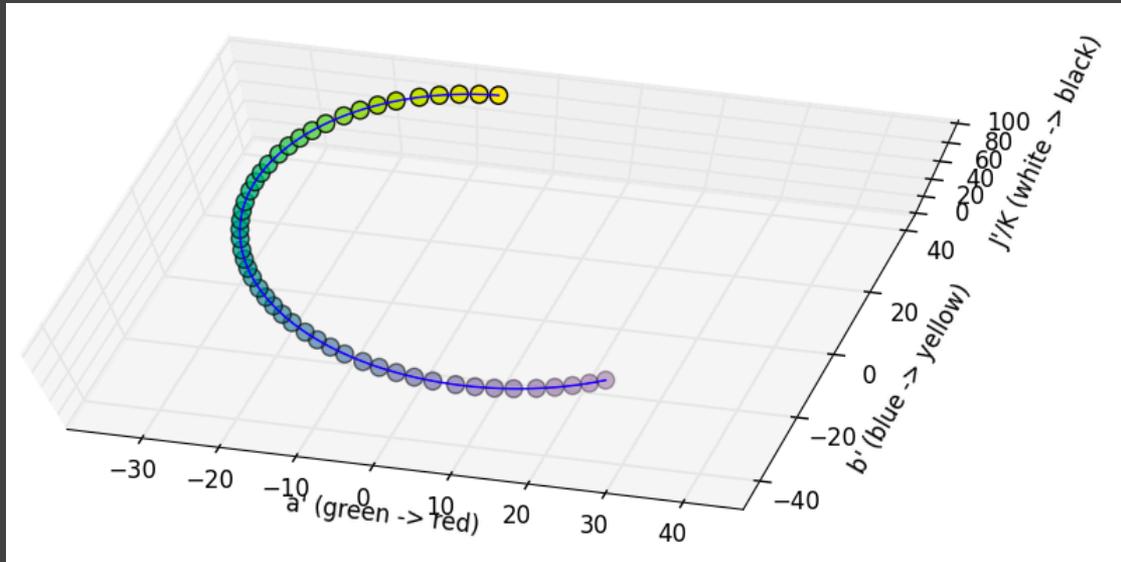

Sequential Scales: Single-Hue

Ramp primarily in luminance, subtle hue difference

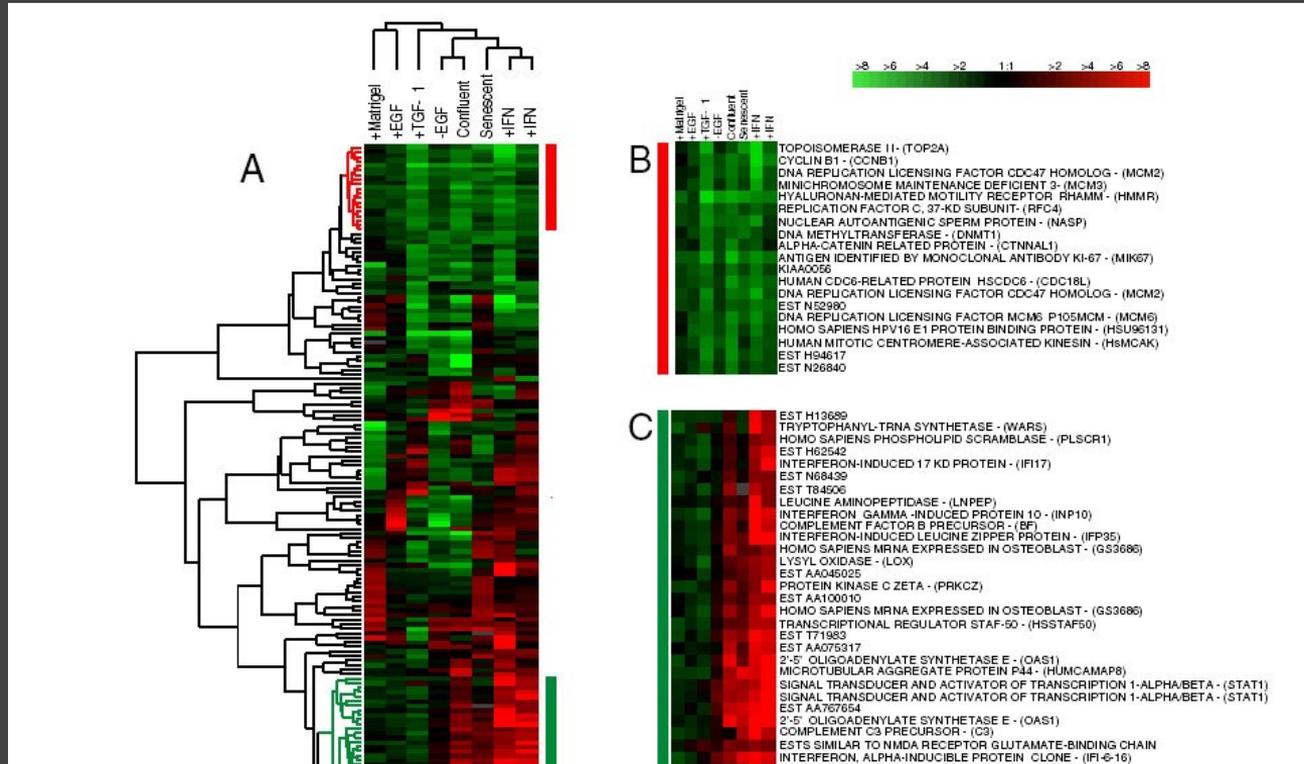

Sequential Scales: Multi-Hue

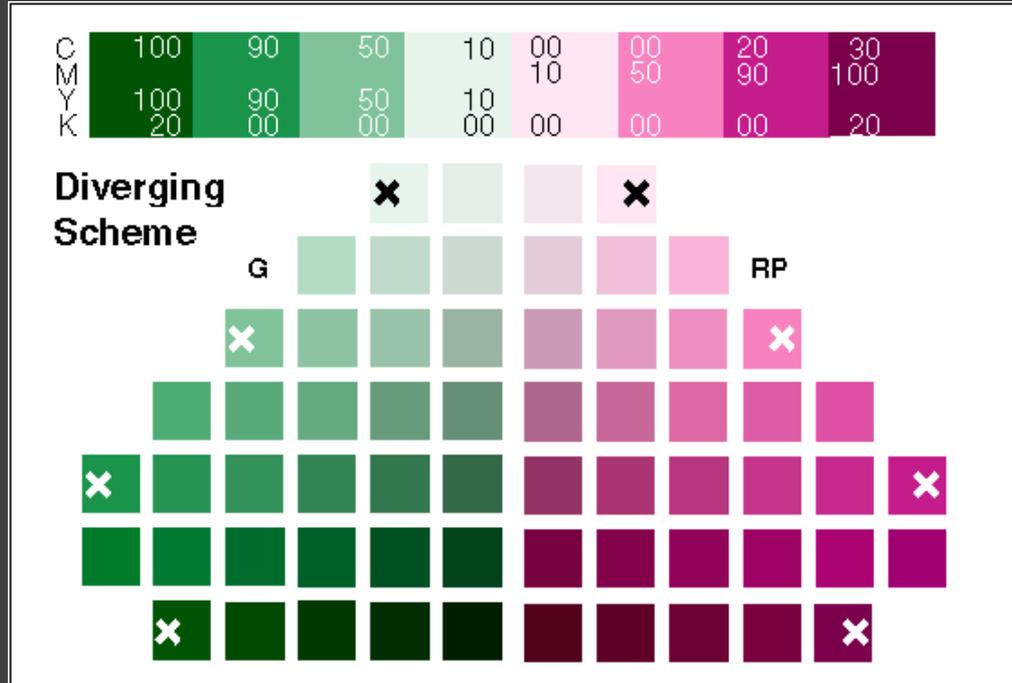

Ramp luminance & hue in perceptual color space
Avoid contrasts subject to color blindness!

Diverging Color Scheme

Designing Diverging Scales

Designing Diverging Scales

Hue Transition

Carefully Handle Midpoint

Choose classes of values

Low, Average, High - Average should be gray

Critical Breakpoint

Defining value e.g., 0

Positive & negative should use different hues

Extremes saturated, middle desaturated

Hints for the Colorist

Use **only a few** colors (~6 ideal)

Colors should be **distinctive** and **named**

Strive for color **harmony** (natural colors?)

Use **cultural conventions**; appreciate symbolism

Get it right in **black and white**

Respect the **color blind**

Take advantage of **perceptual color spaces**

Color is cultural and a matter of taste!
