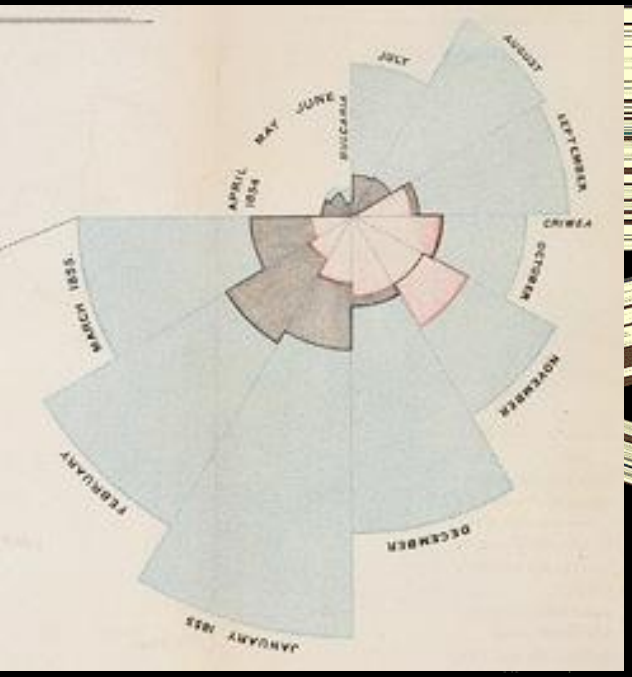
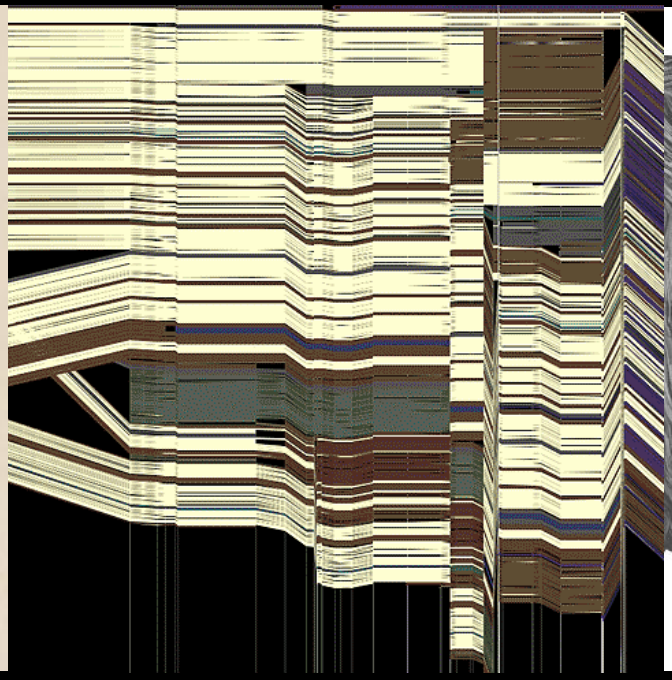
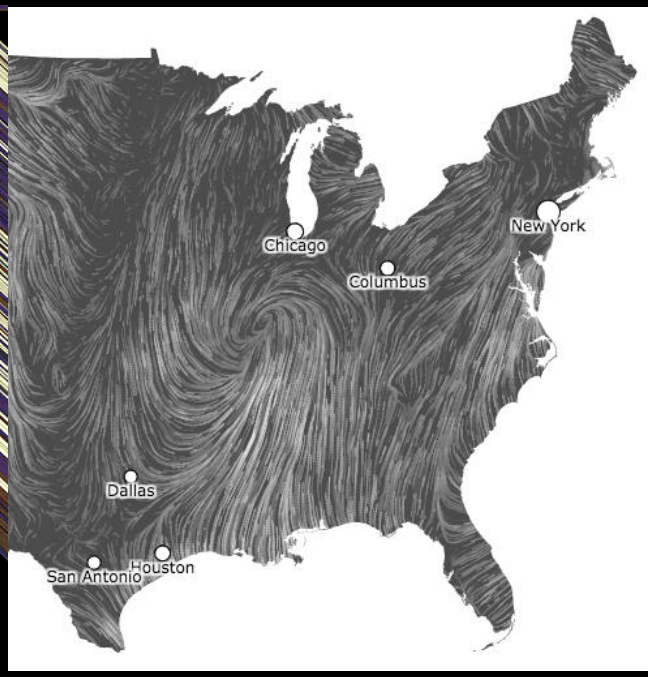
CSE 442 - Data Visualization

Networks



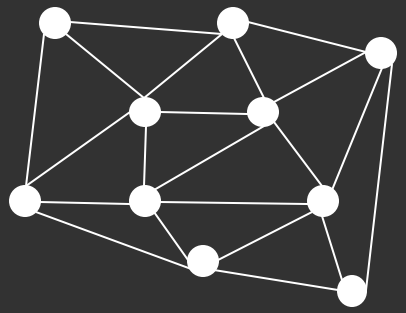




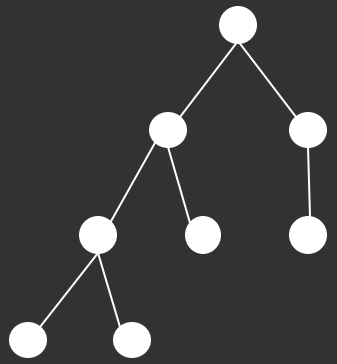
Leilani Battle University of Washington

Graphs and Trees

Graphs
Model relations among data
Nodes and *edges*



Trees
Graphs with hierarchical structure
Connected graph with N-1 edges
Nodes as *parents* and *children*



Spatial Layout

A primary concern of tree/graph drawing is the spatial arrangement of nodes and edges.

Often (but not always) the goal is to effectively depict the graph structure:

- Connectivity, path-following
- Topological distance
- Clustering / grouping
- Ordering (e.g., hierarchy level)

Applications

Tournaments
Organization Charts
Genealogy
Diagramming (e.g., Visio)
Biological Interactions (Genes, Proteins)
Computer Networks
Social Networks
Simulation and Modeling
Integrated Circuit Design

Network Analysis Tasks [Pretorius '13]

Structure-based: relationships and connectivity

Attribute-based: specific node/link attributes

Browsing: understand paths in the data

Estimation: summarization and temporal changes

Network Analysis Tasks [Pretorius '13]

Structure-based: relationships and connectivity

Find all of the friends of friends for Taylor.
Find all of the people who are friends with Jordan and Alex.
Six degrees of separation: shortest path between two individuals.

Attribute-based: specific node/link attributes

Browsing: understand paths in the data

Estimation: summarization and temporal changes

Network Analysis Tasks [Pretorius '13]

Structure-based: relationships and connectivity

Find all of the friends of friends for Taylor.
Find all of the people who are friends with Jordan and Alex.
Six degrees of separation: shortest path between two individuals.

Attribute-based: specific node/link attributes

Find all "students" taking CSE442.
Find all the "friends" and "family" of Alex.

Browsing: understand paths in the data

Estimation: summarization and temporal changes

Network Analysis Tasks [Pretorius '13]

Structure-based: relationships and connectivity

Find all of the friends of friends for Taylor.
Find all of the people who are friends with Jordan and Alex.
Six degrees of separation: shortest path between two individuals.

Attribute-based: specific node/link attributes

Find all "students" attending CSE442.
Find all the "friends" and "family" of Alex.

Browsing: understand paths in the data

Find Alex's friend Taylor, and then Taylor's friend Jordan.

Estimation: summarization and temporal changes

Network Analysis Tasks [Pretorius '13]

Structure-based: relationships and connectivity

Find all of the friends of friends for Taylor.
Find all of the people who are friends with Jordan and Alex.
Six degrees of separation: shortest path between two individuals.

Attribute-based: specific node/link attributes

Find all "students" attending CSE442.
Find all the "friends" and "family" of Alex.

Browsing: understand paths in the data

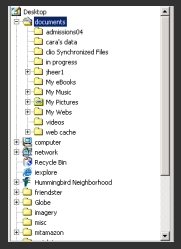
Find Alex's friend Taylor, and then Taylor's friend Jordan.

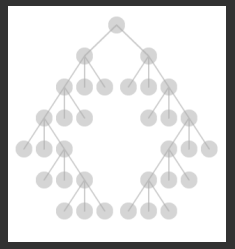
Estimation: summarization and temporal changes

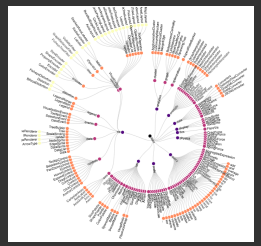
How does Jordan's friend group change over the course of the year?

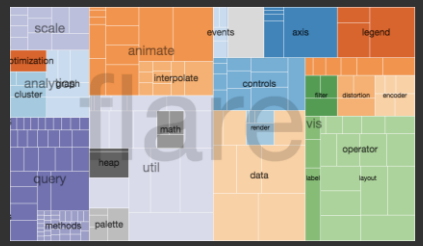
Topics

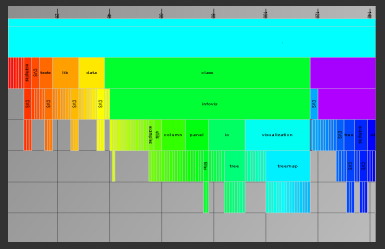
Tree Visualization

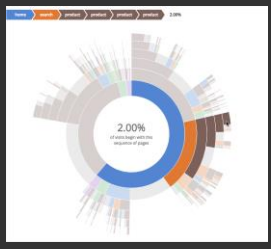




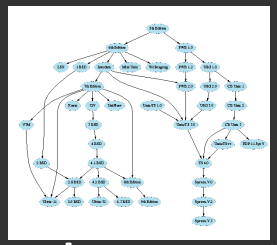


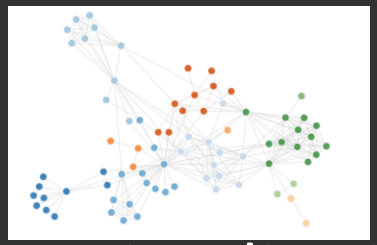


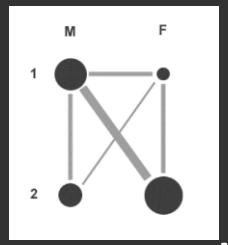


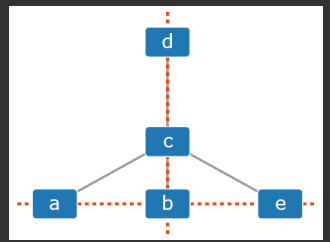


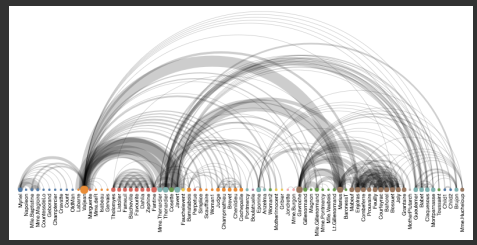
Graph Layout: Node-Link Diagrams



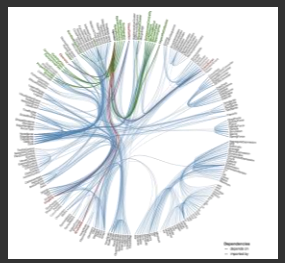








Alternative Visualizations and Techniques



Select an image to jump to those slides.

Tree Visualization

Tree Visualization

Indentation

Linear list, indentation encodes depth

Node-Link diagrams

Nodes connected by lines/curves

Enclosure diagrams

Represent hierarchy by enclosure

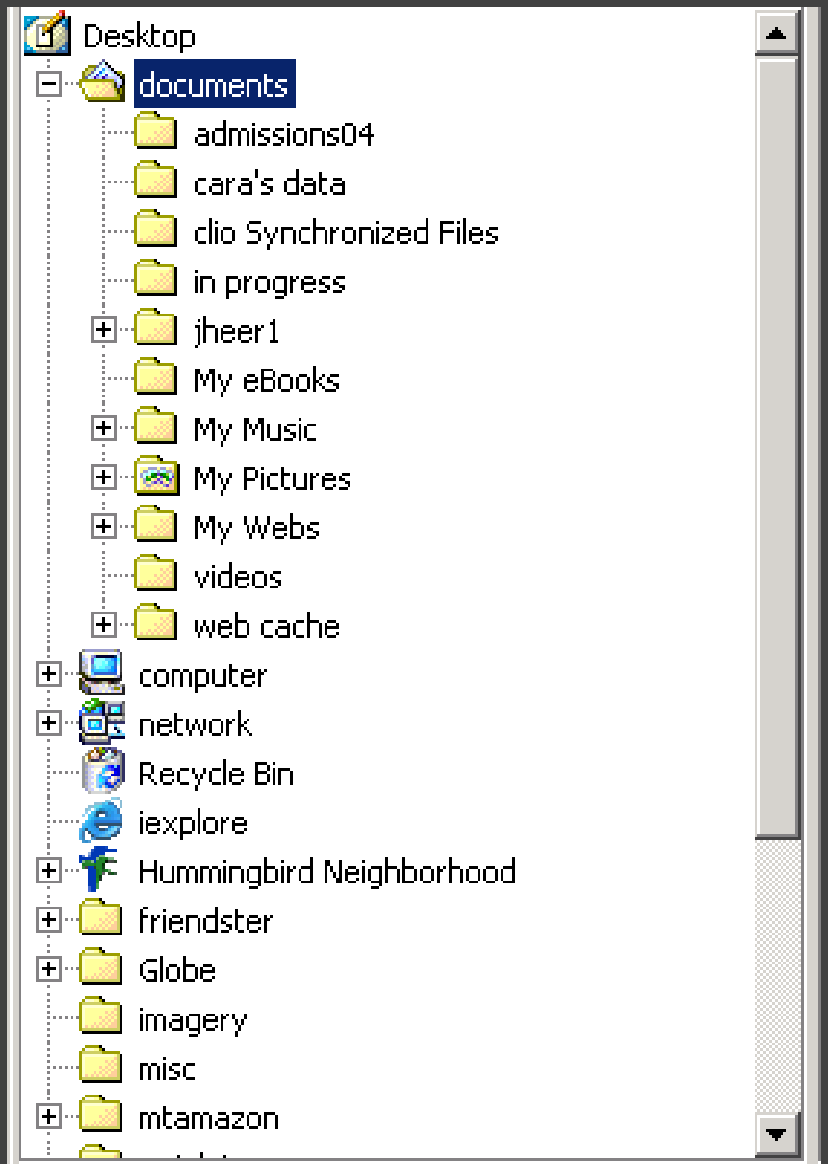
Layering

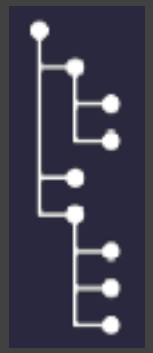
Relative position and alignment

Typically fast: O(n) or O(n log n), interactive layout

Indentation

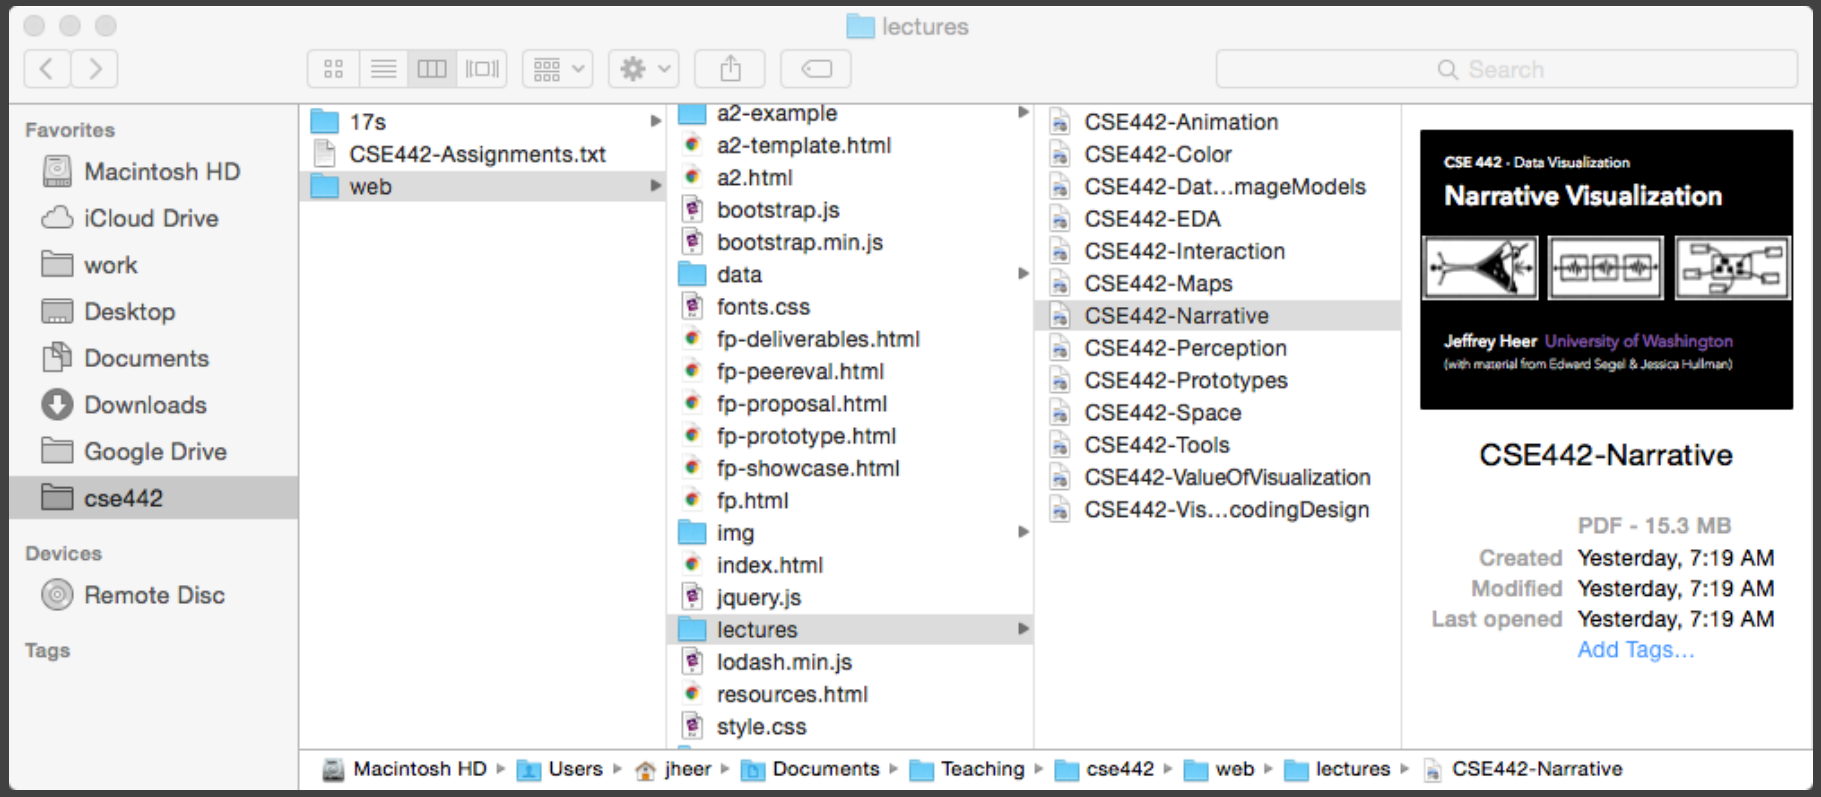
Indentation





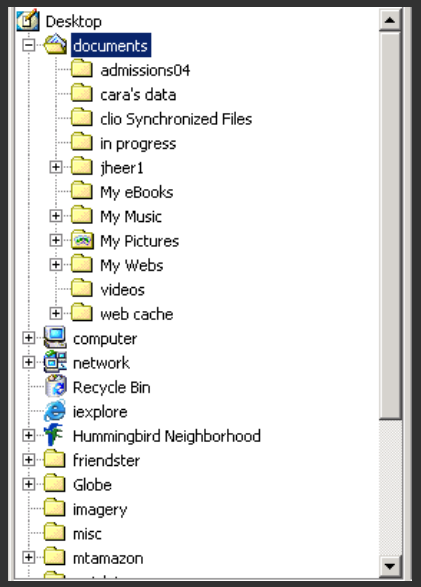
- Places all items along vertically spaced rows
- Indentation used to show parent/child relationships
- Commonly used as a component in an interface
- Breadth and depth contend for space
- Often requires a great deal of scrolling

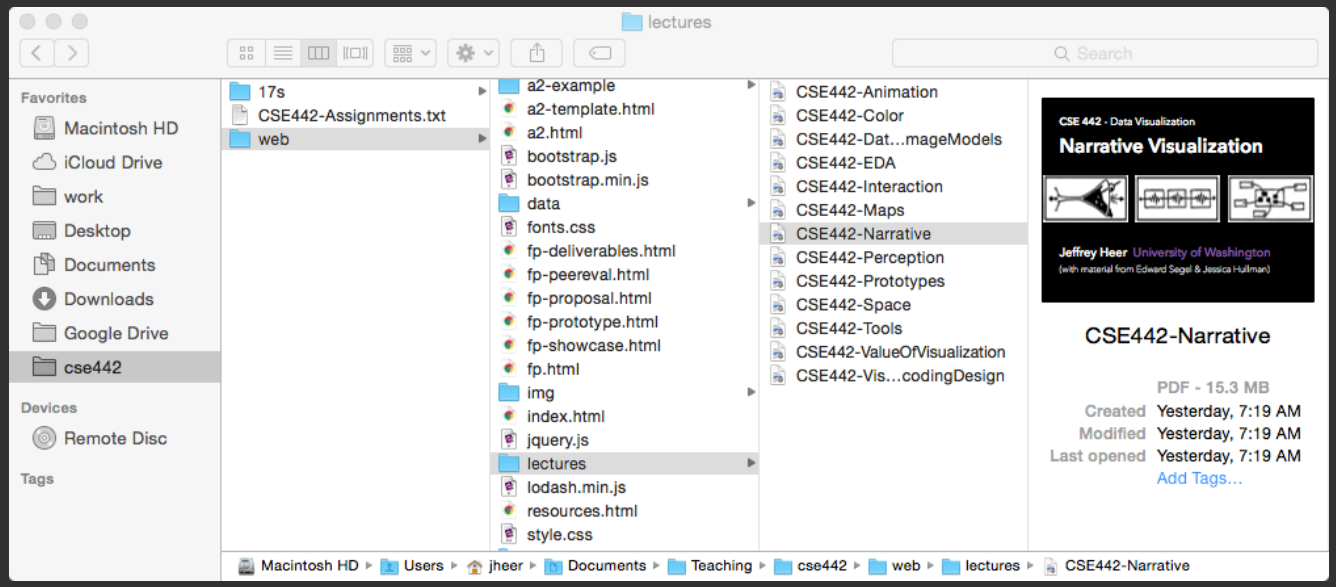
Single-Focus (Accordion) List



Separate breadth & depth along 2D.
Focus on a single path at a time.

What tasks are these good for?





What tasks is indentation good for?

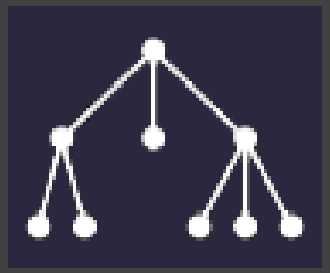
Benefits:
Easy navigation, Seeing Parent-Child Relationships
Browsing tasks, Structure-Based tasks

Problems:
Network Overview, Comparison
Estimation tasks

Missing:
Attribute-Based encodings

Node-Link Diagrams

Node-Link Diagrams



Nodes are distributed in space, connected by straight or curved lines

Typical approach is to use 2D space to break apart breadth and depth

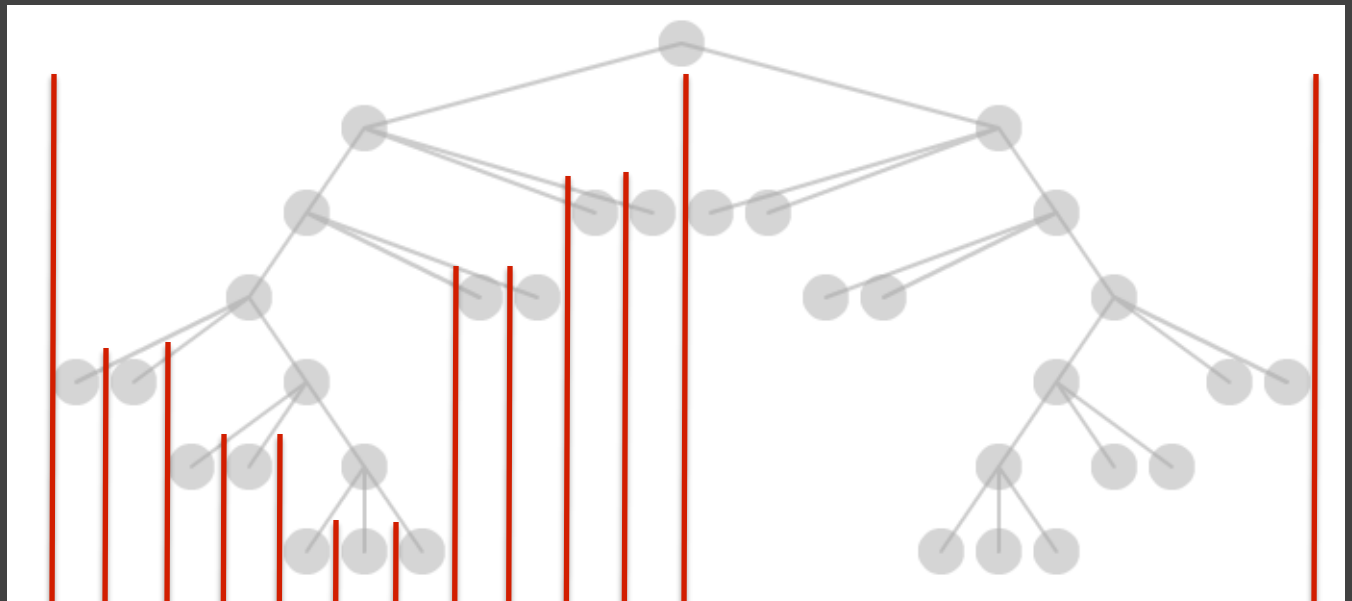
Often space is used to communicate hierarchical orientation (e.g., towards authority or generality)

Naïve Recursive Layout

Repeatedly divide space for subtrees by leaf count

Breadth of tree along one dimension

Depth along the other dimension



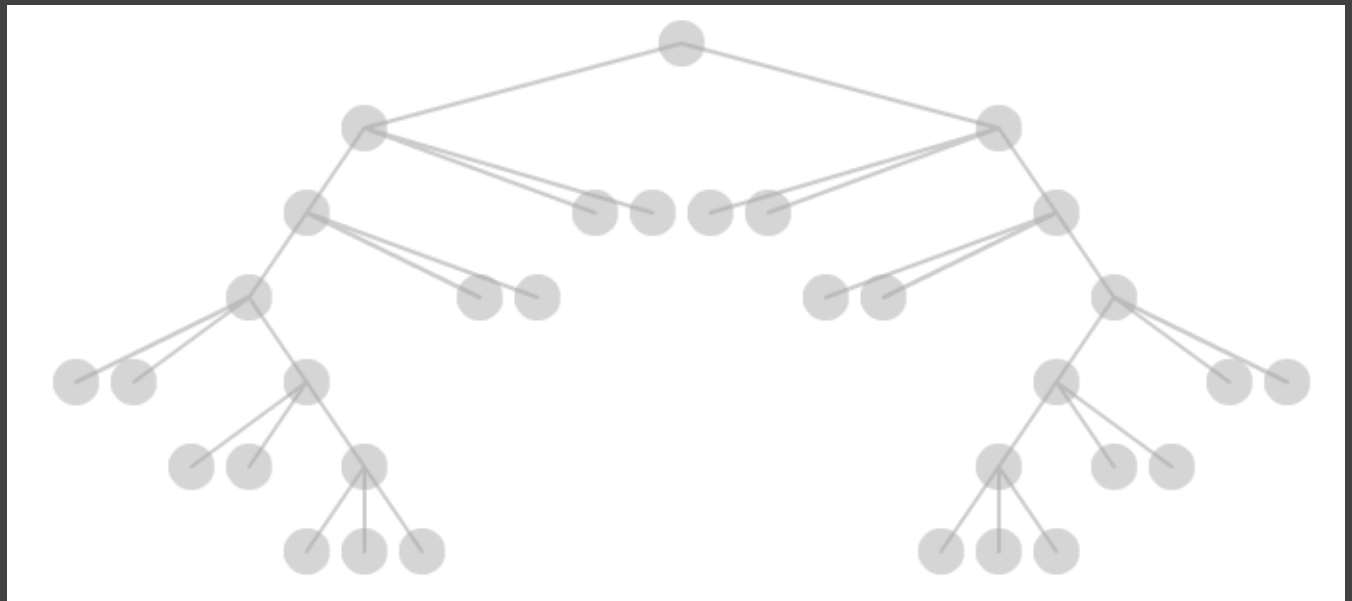
Naïve Recursive Layout

Repeatedly divide space for subtrees by leaf count

Breadth of tree along one dimension

Depth along the other dimension

Problems?



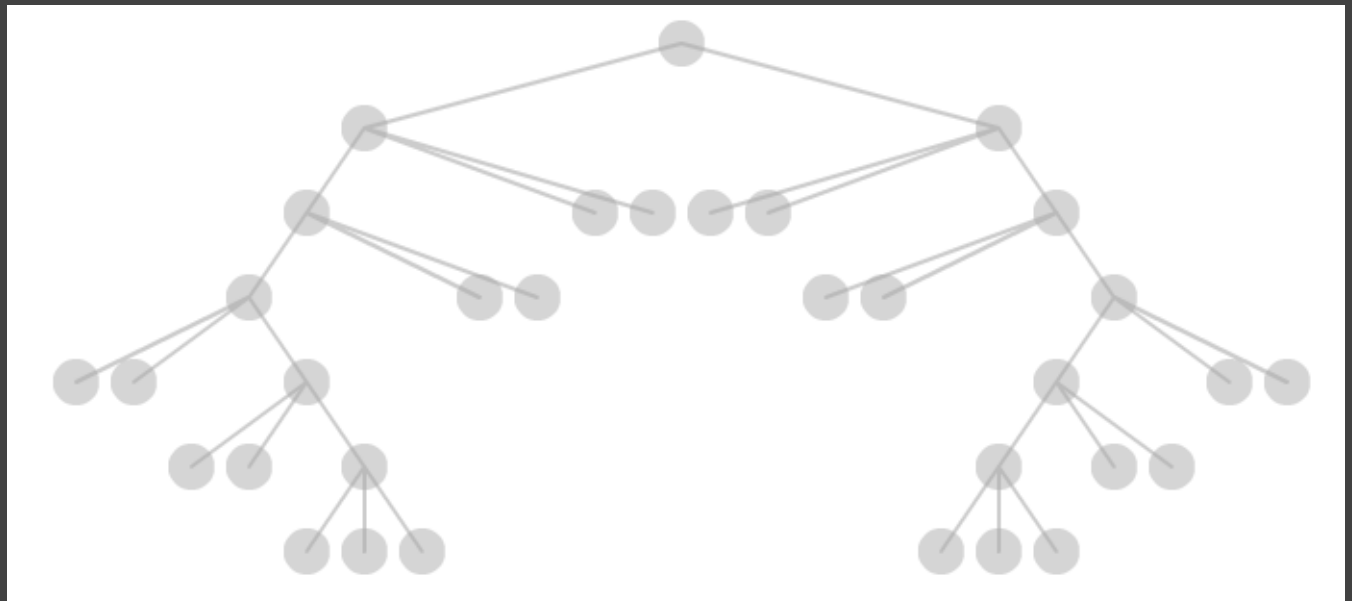
Naïve Recursive Layout

Repeatedly divide space for subtrees by leaf count

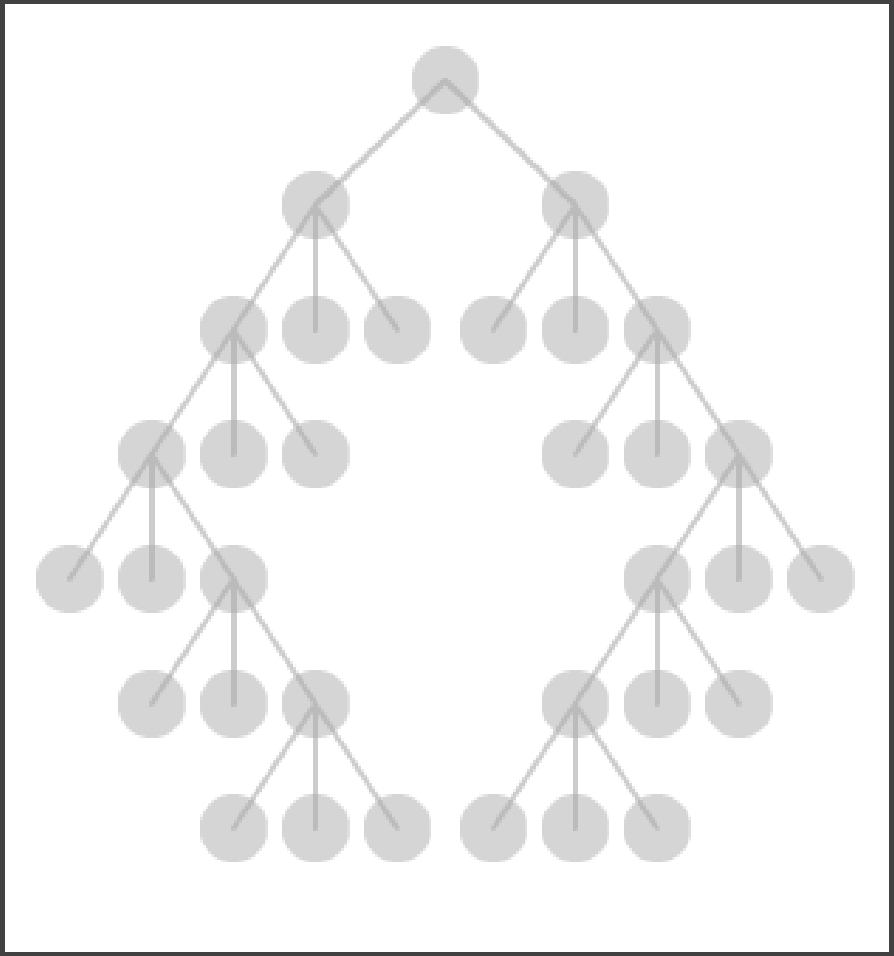
Breadth of tree along one dimension

Depth along the other dimension

Problem: exponential growth of breadth



Reingold & Tilford's "Tidy" Layout

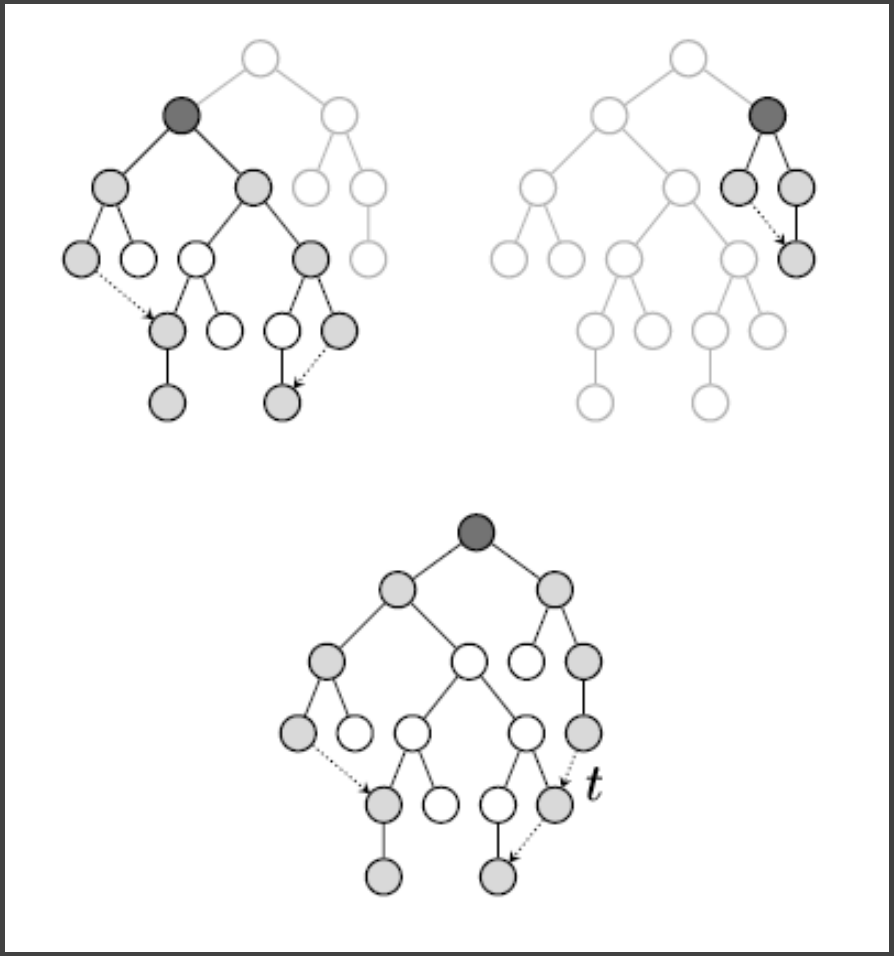


Goal: make smarter use of space, maximize density and symmetry.

Originally binary trees, extended by Walker to cover general case.

Corrected by Buchheim et al. to achieve a linear time algorithm.

Reingold-Tilford Layout



Design Considerations

Clearly encode depth

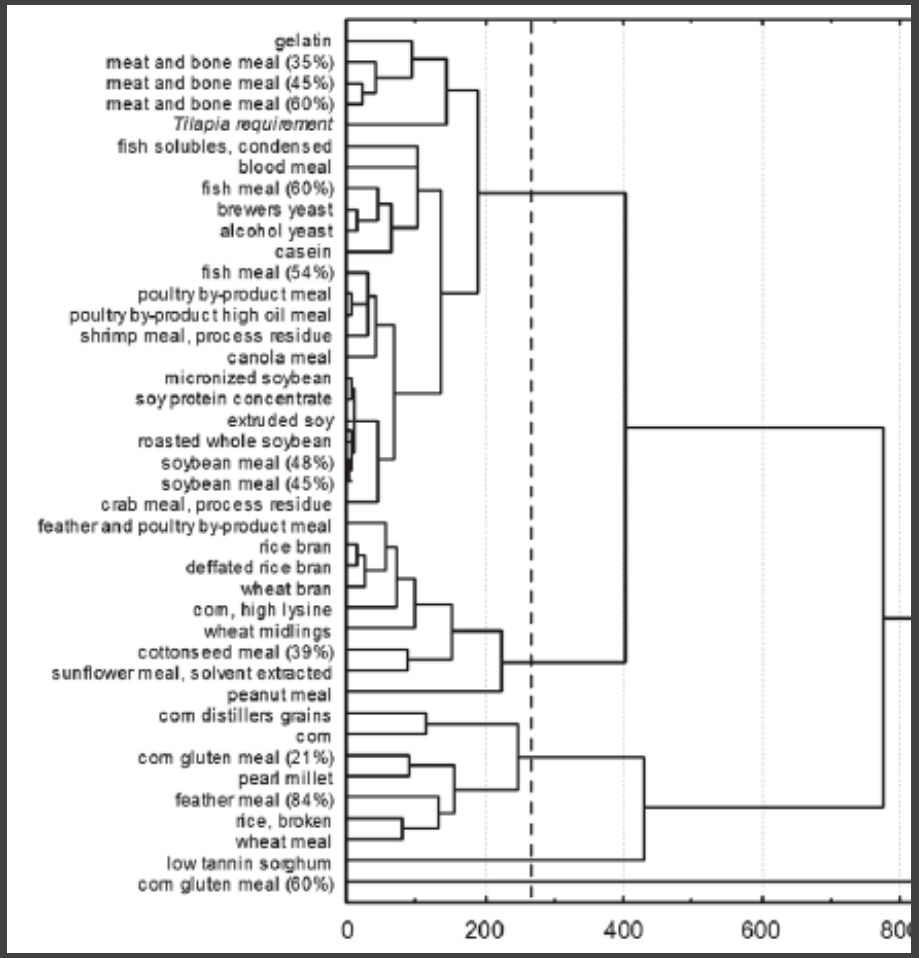
No edge crossings

Draw isomorphic subtrees identically (same shape)

Preserve layout ordering and symmetry

Compact, space-saving layout (don't waste space)

Cluster Dendrograms

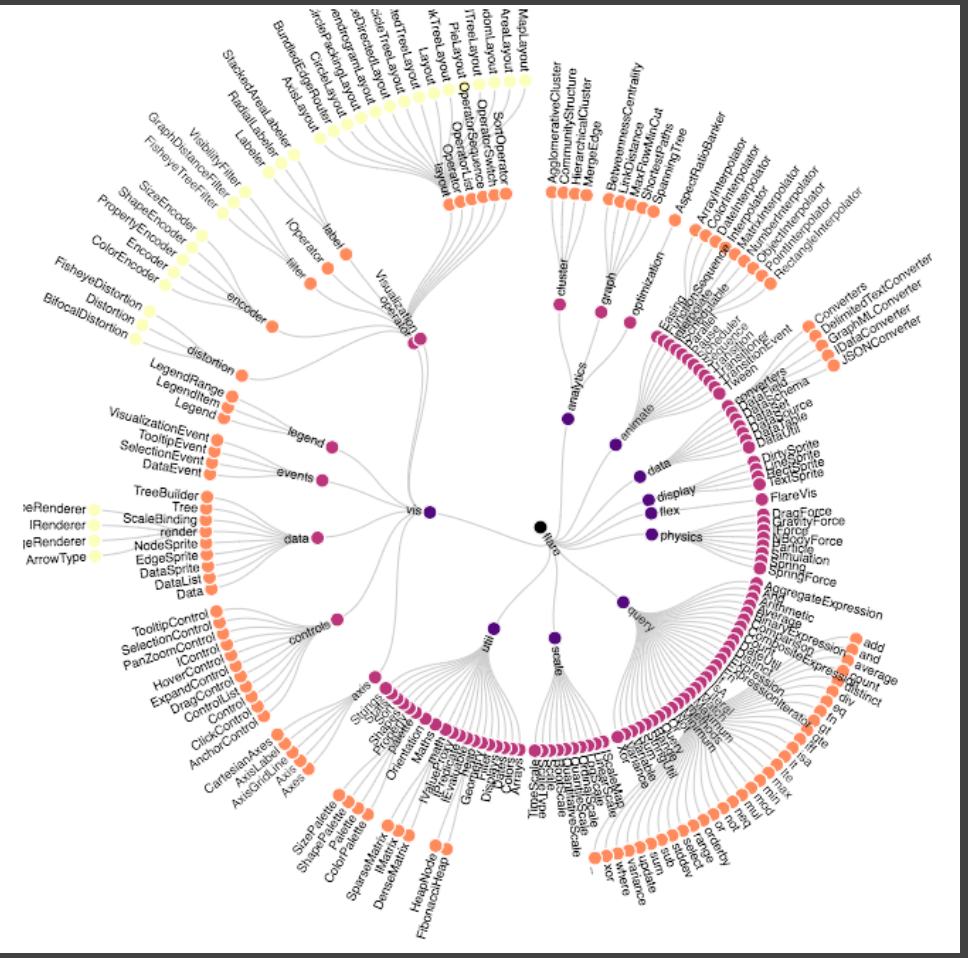


Depicts cluster trees produced by hierarchical clustering algorithms.

Leaf nodes arranged in a line, internal node depth indicates order/value at which clusters merge.

Naïve recursive layout with orthogonal two-segment edges.

Radial Tree Layout



Node-link diagram in polar co-ordinates.

Radius encodes depth, with root in the center.

Angular sectors assigned to subtrees (often with naïve recursive layout).

Reingold-Tilford method can also be applied here.

What are **n**ode-link diagrams good for?

Benefits

Clearly depicts node relationships / structure

Structure-based and Browsing tasks

Problems

Even with tidy layout, quickly run out of space

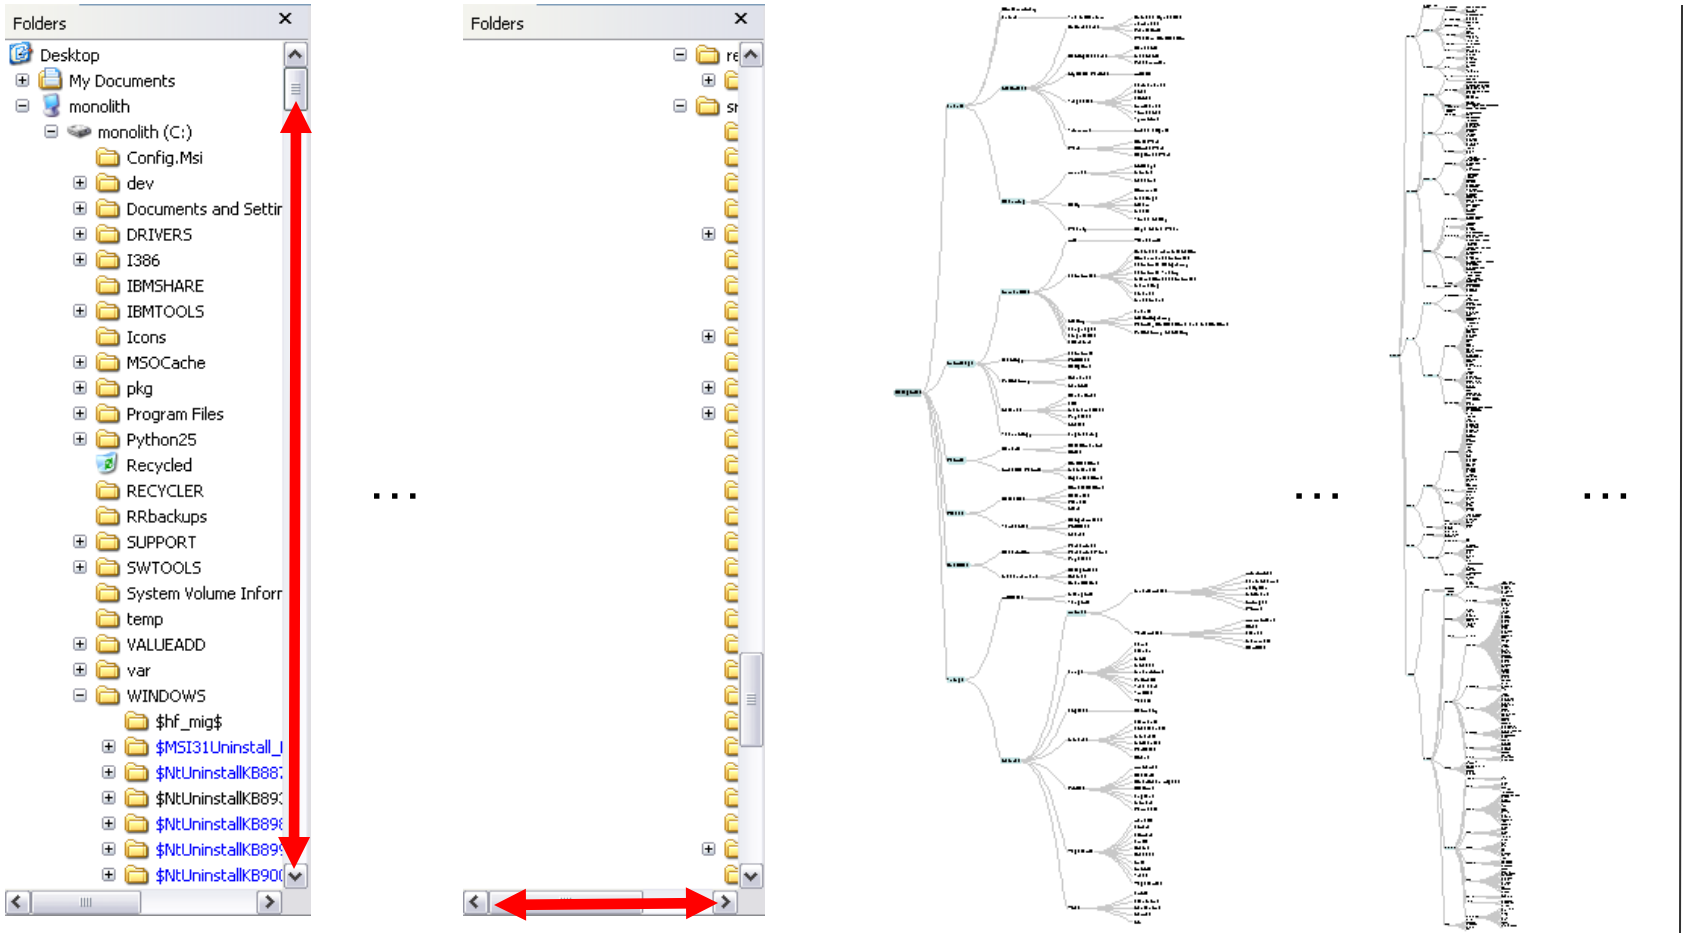
Limits Estimation tasks

(Still) Missing

Attribute-based encodings

Focus+Context for Navigating Larger Networks

Visualizing Large Hierarchies



Indented Layout

Reingold-Tilford Layout

More Nodes, More Problems…

Scale

Tree breadth often grows exponentially

Even with tidy layout, quickly run out of space

Possible Solutions

Filtering

Focus+Context

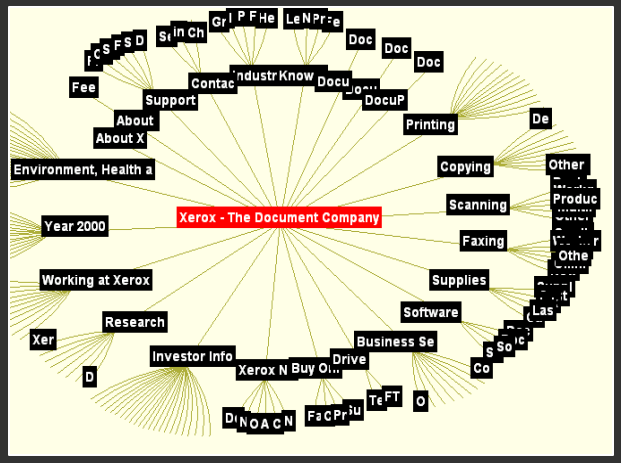
Scrolling or Panning

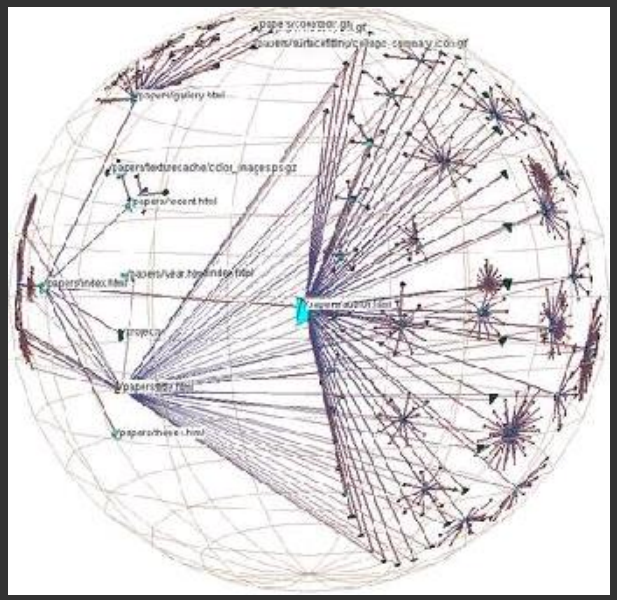
Zooming

Aggregation

MC Escher, *Circle Limit IV*

Hyperbolic Layout



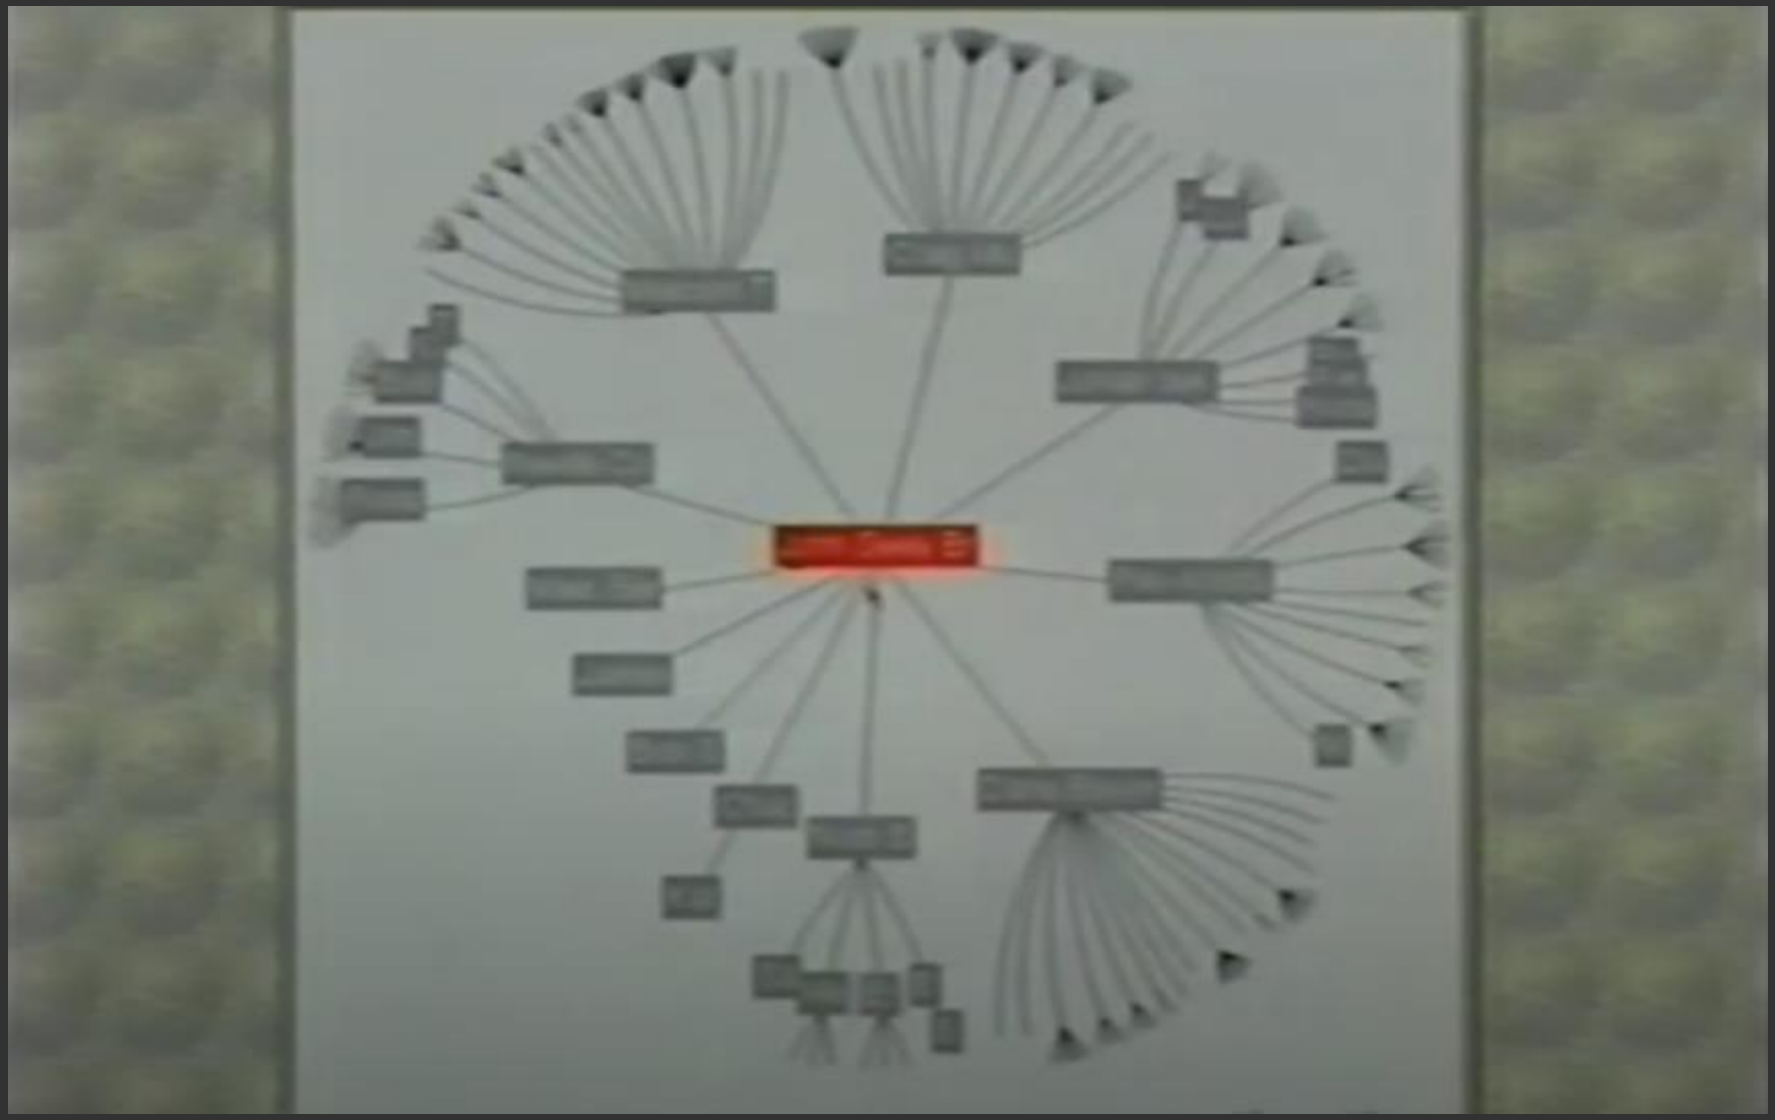


Perform tree layout in hyperbolic geometry, project the result on to the Euclidean plane.

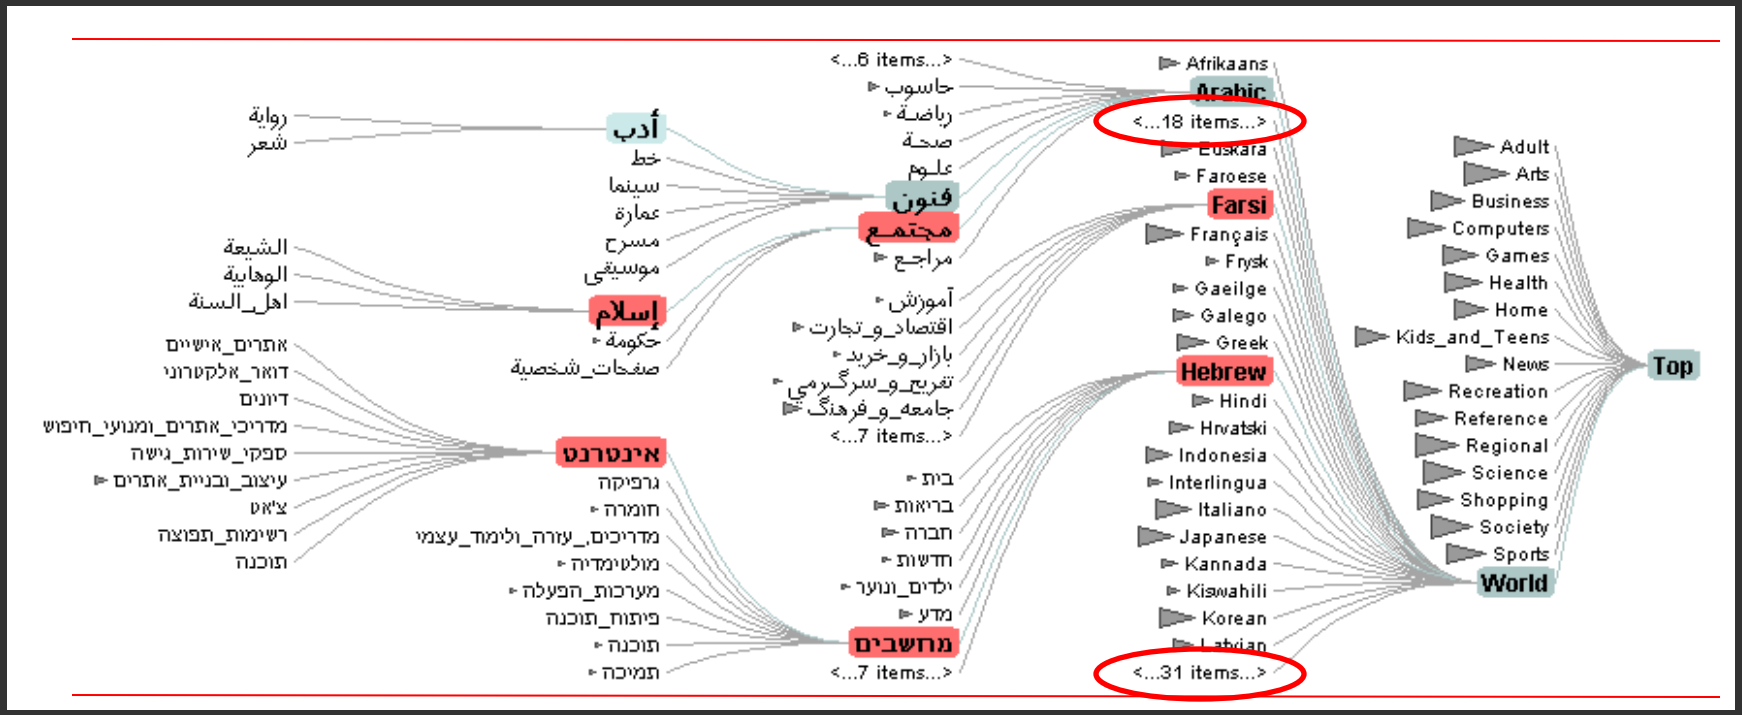
Why? Like tree breadth, the hyperbolic plane expands exponentially!

Also computable in 3D, projected into a sphere.

Hyperbolic Layout

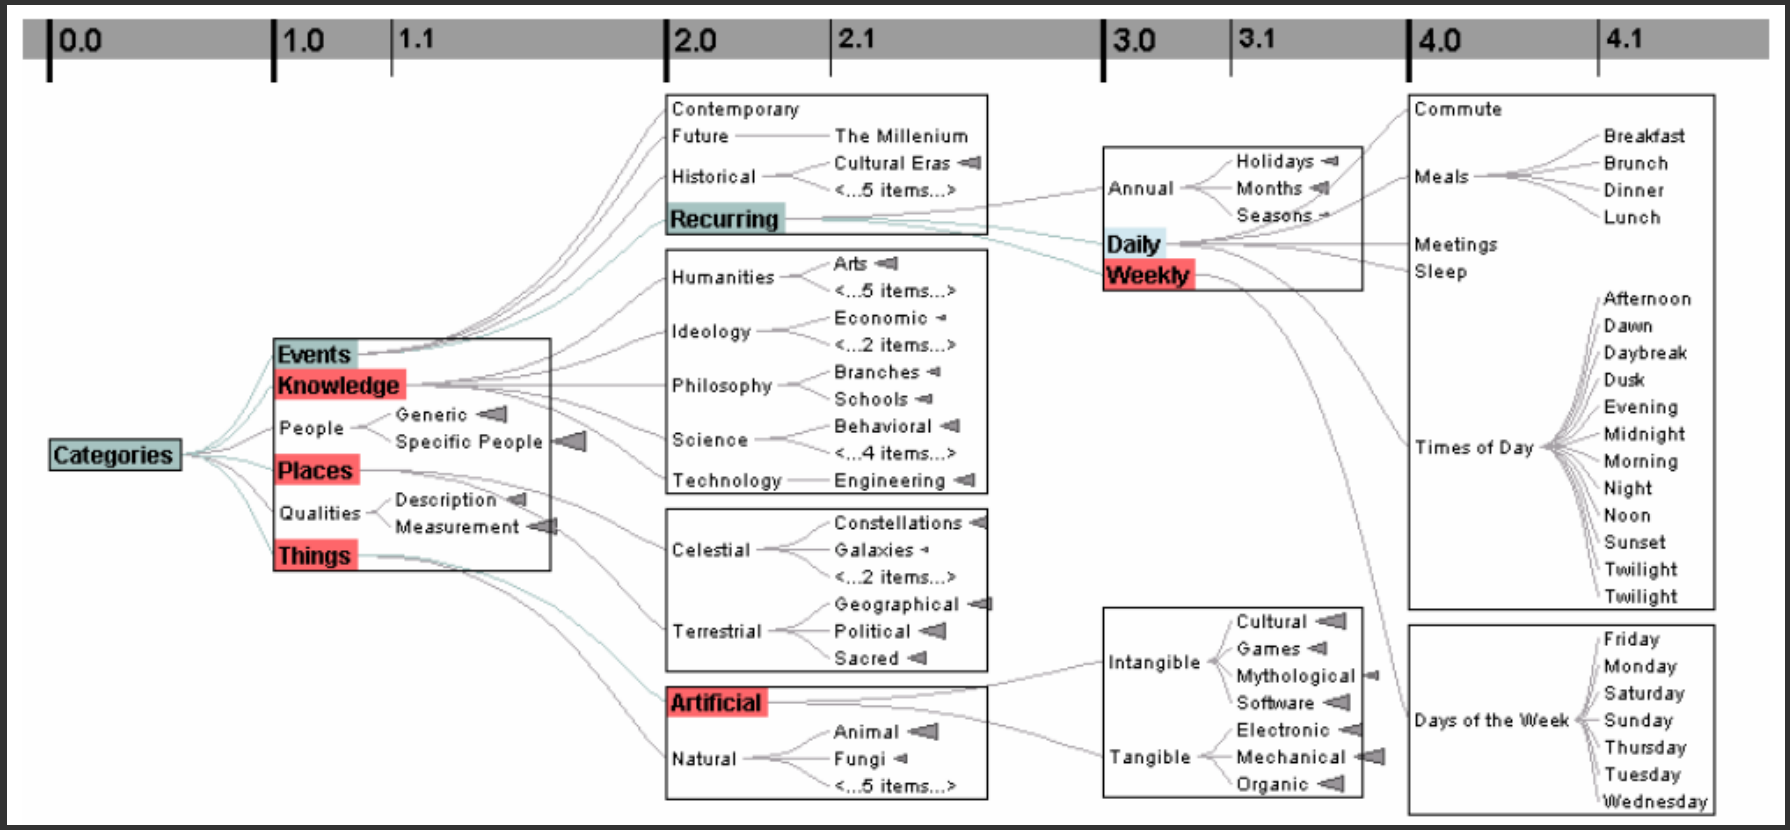


Degree-of-Interest Trees



Space-constrained, multi-focal tree layout

Degree-of-Interest Trees

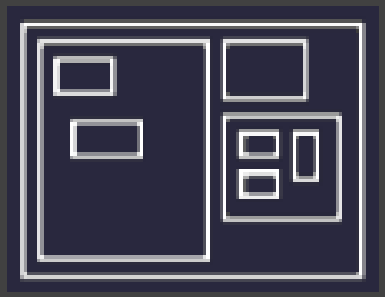


Remove “low interest” nodes at a given depth level until all blocks on a level fit within bounds.

Attempt to center child blocks beneath parents.

Enclosure

Enclosure Diagrams



Encode structure using **spatial enclosure**
Popularly known as **treemaps**

Provides a single view of an entire tree
Encodes an attribute as mark size

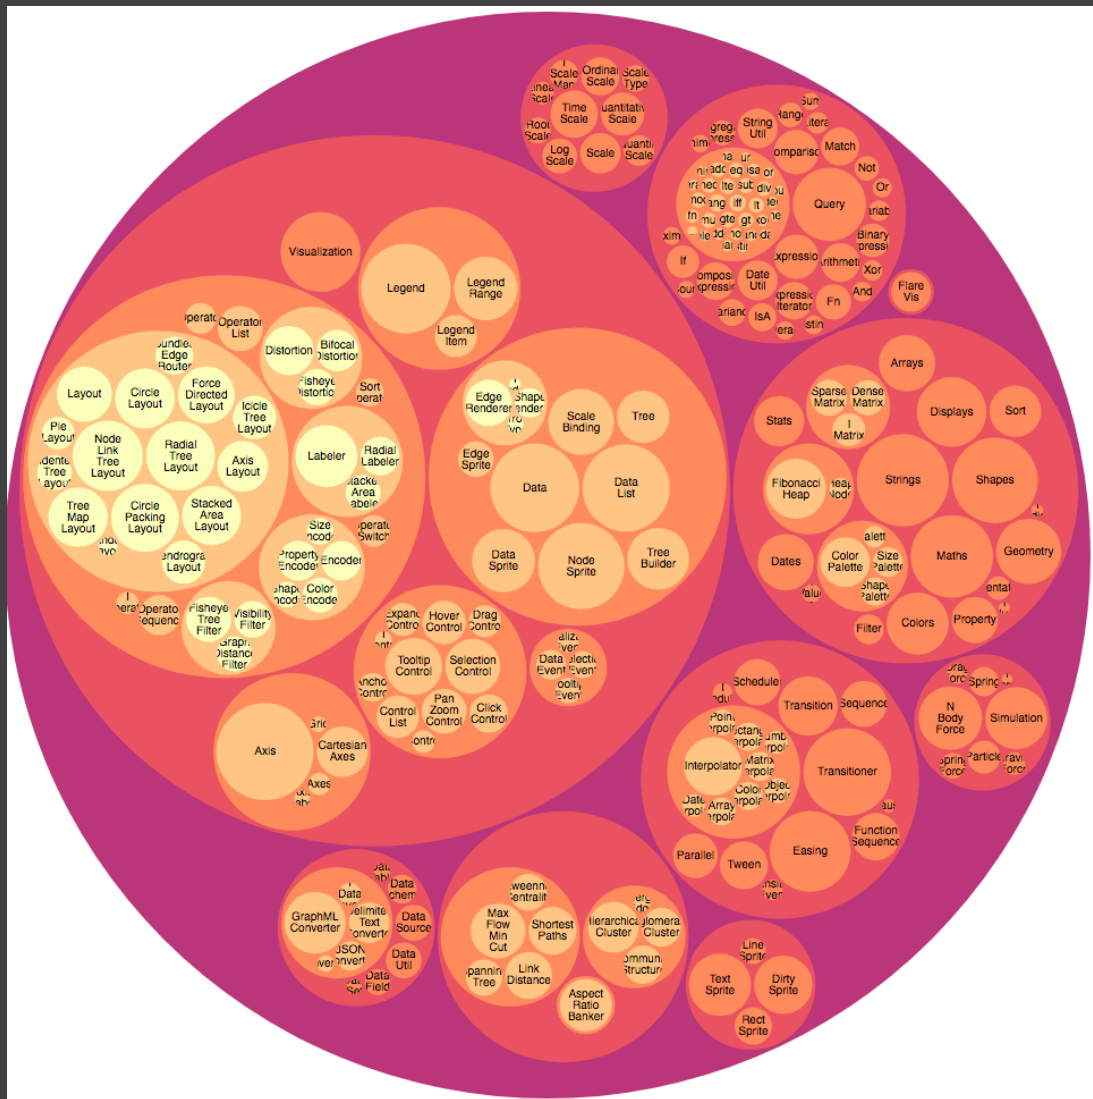
Difficult to accurately read structure / depth

Circle Packing Layout

Nodes are represented as sized circles.

Nesting shows parent-child relationships.

Issues?
Inefficient use of space.
Parent size misleading?

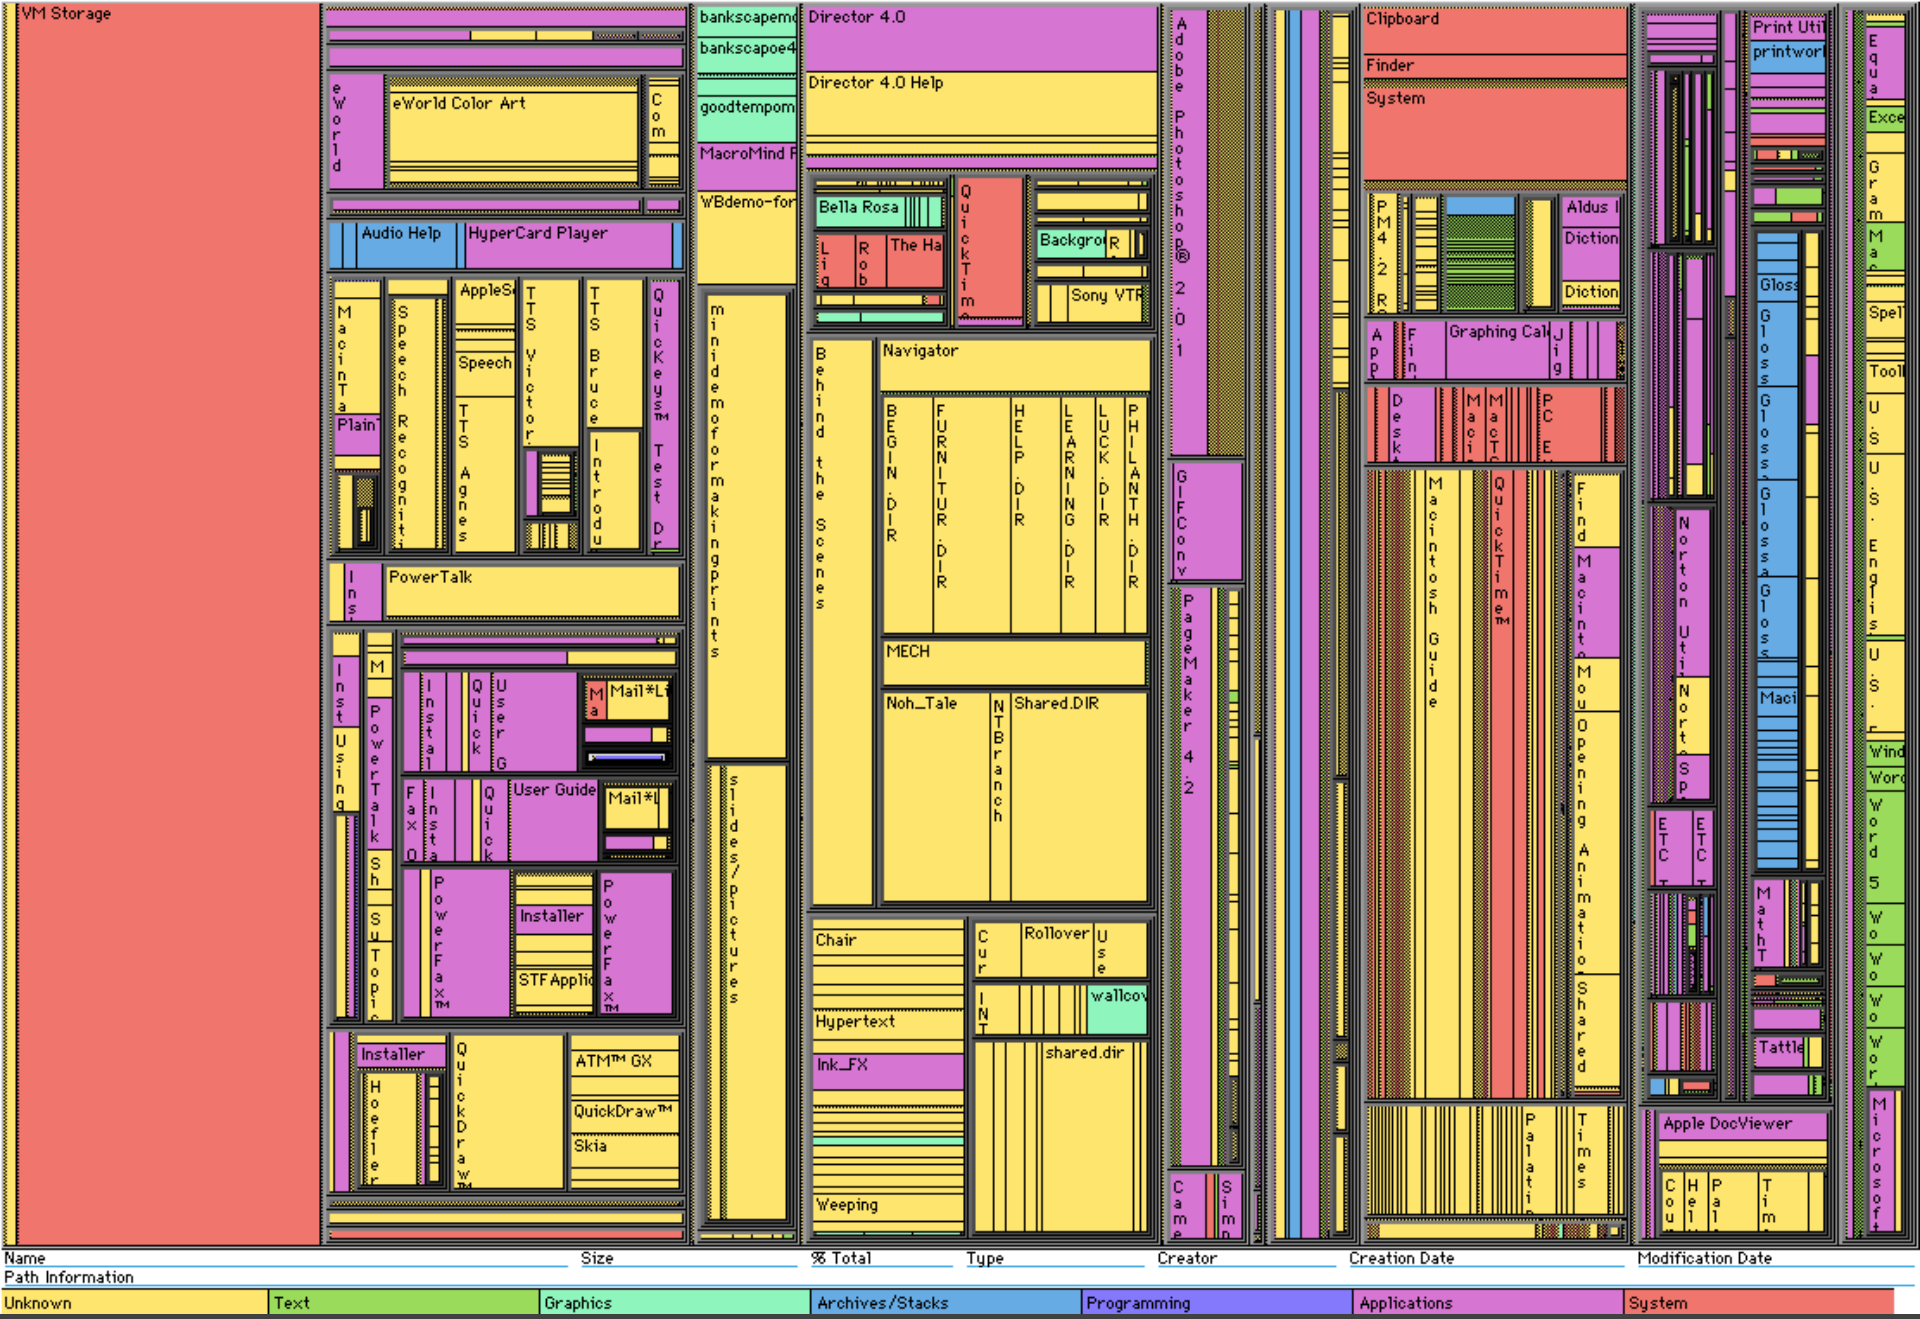


Treemaps

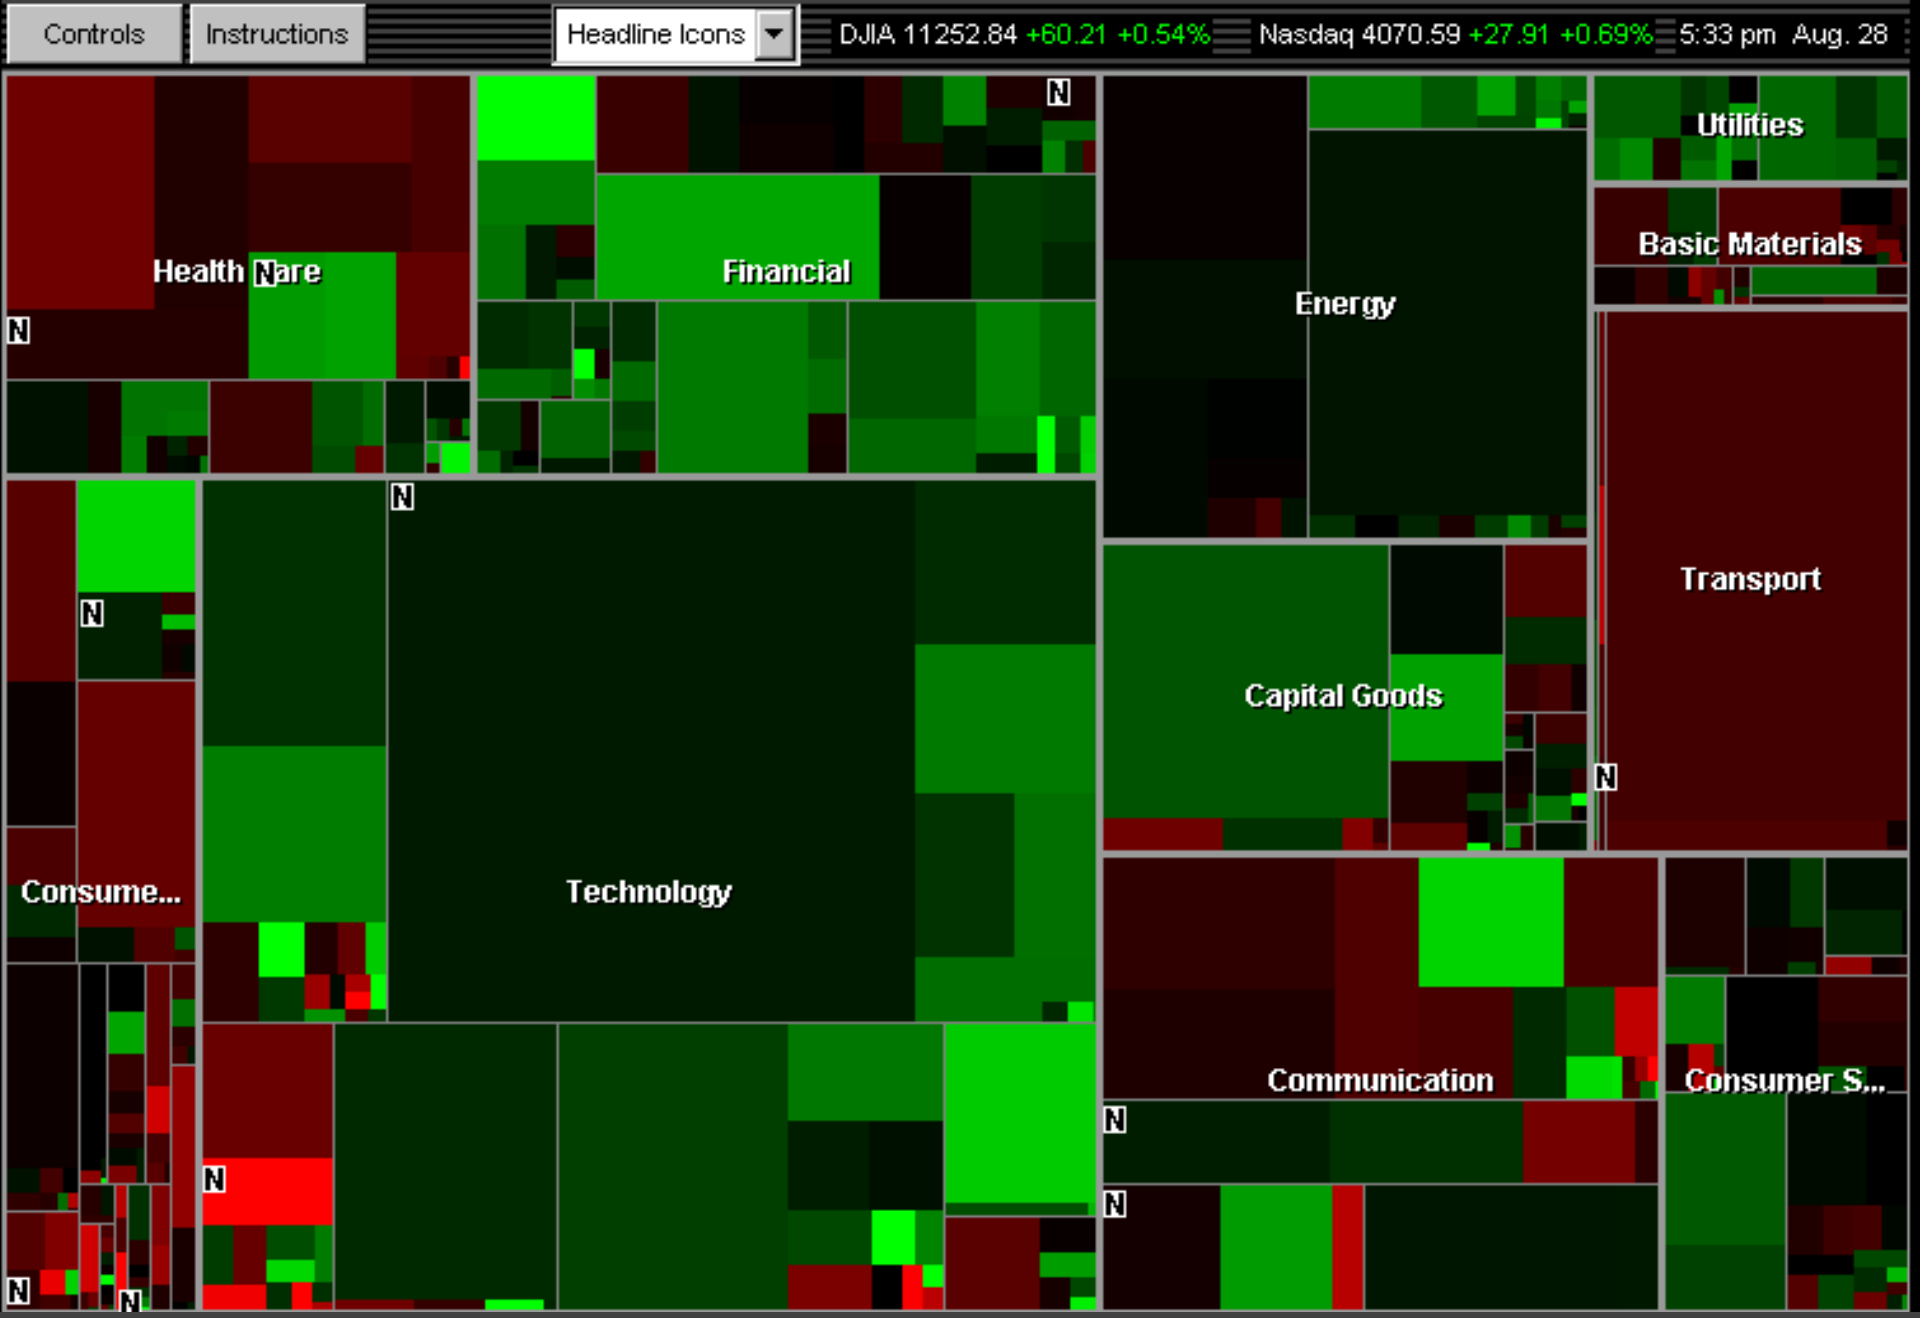
Hierarchy visualization that emphasizes values of nodes via area encoding.

Partition 2D space such that leaf nodes have sizes proportional to data values.

First layout algorithms proposed by Shneiderman et al. in 1990, with focus on showing file sizes on a hard drive.



Slice & Dice layout: Alternate horizontal / vertical partitions.

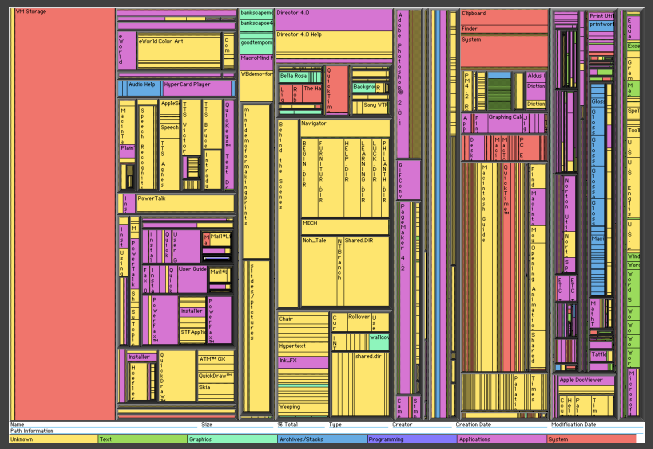


Squarifed layout: Try to produce square (1:1) aspect ratios

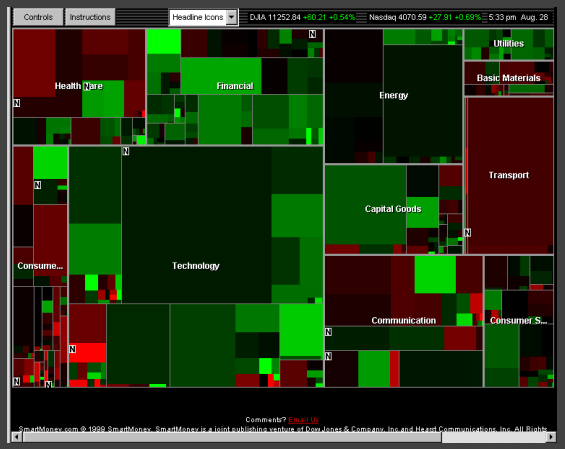
Squarified Treemaps [Bruls et al. ’00]

Slice & Dice layout suffers from extreme aspect ratios. How might we do better?

Squarified layout: greedy optimization for objective of square rectangles. Slice/dice within siblings; alternate whenever ratio worsens.



vs.



Why Squares? [Bruls et al. ’00]

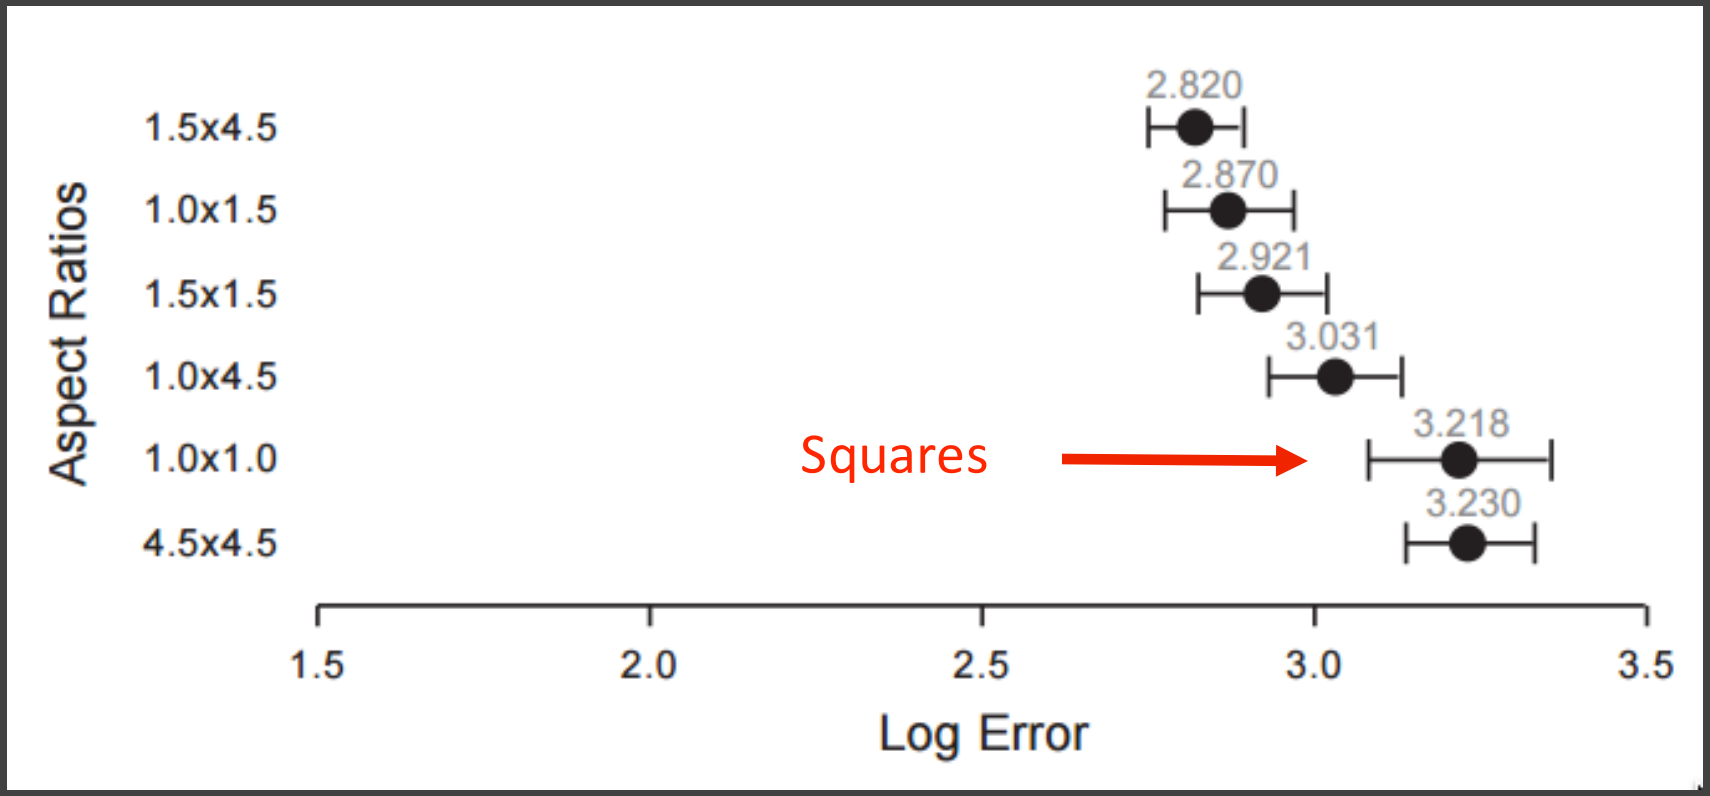
Posited Benefits of 1:1 Aspect Ratios

1. Minimize perimeter, reducing border ink.
   Mathematically true!

2. Easier to select with a mouse cursor.
   Validated by empirical research & Fitt’s Law!

3. Similar aspect ratios are easier to compare.
   Seems intuitive, but is this true?

Comparison Error vs. Aspect Ratio



Study by Kong, Heer & Agrawala, InfoVis ’10.
Comparison of squares has higher error!
“Squarify” works because it fails to meet its objective?

Why Squares? [Bruls et al. ’00]

Posited Benefits of 1:1 Aspect Ratios

1. Minimize perimeter, reducing border ink.
   Mathematically true!

2. Easier to select with a mouse cursor.
   Validated by empirical research & Fitt’s Law!

3. Similar aspect ratios are easier to compare.
   Seems intuitive, but is this true?

Why Squares? [Bruls et al. ’00]

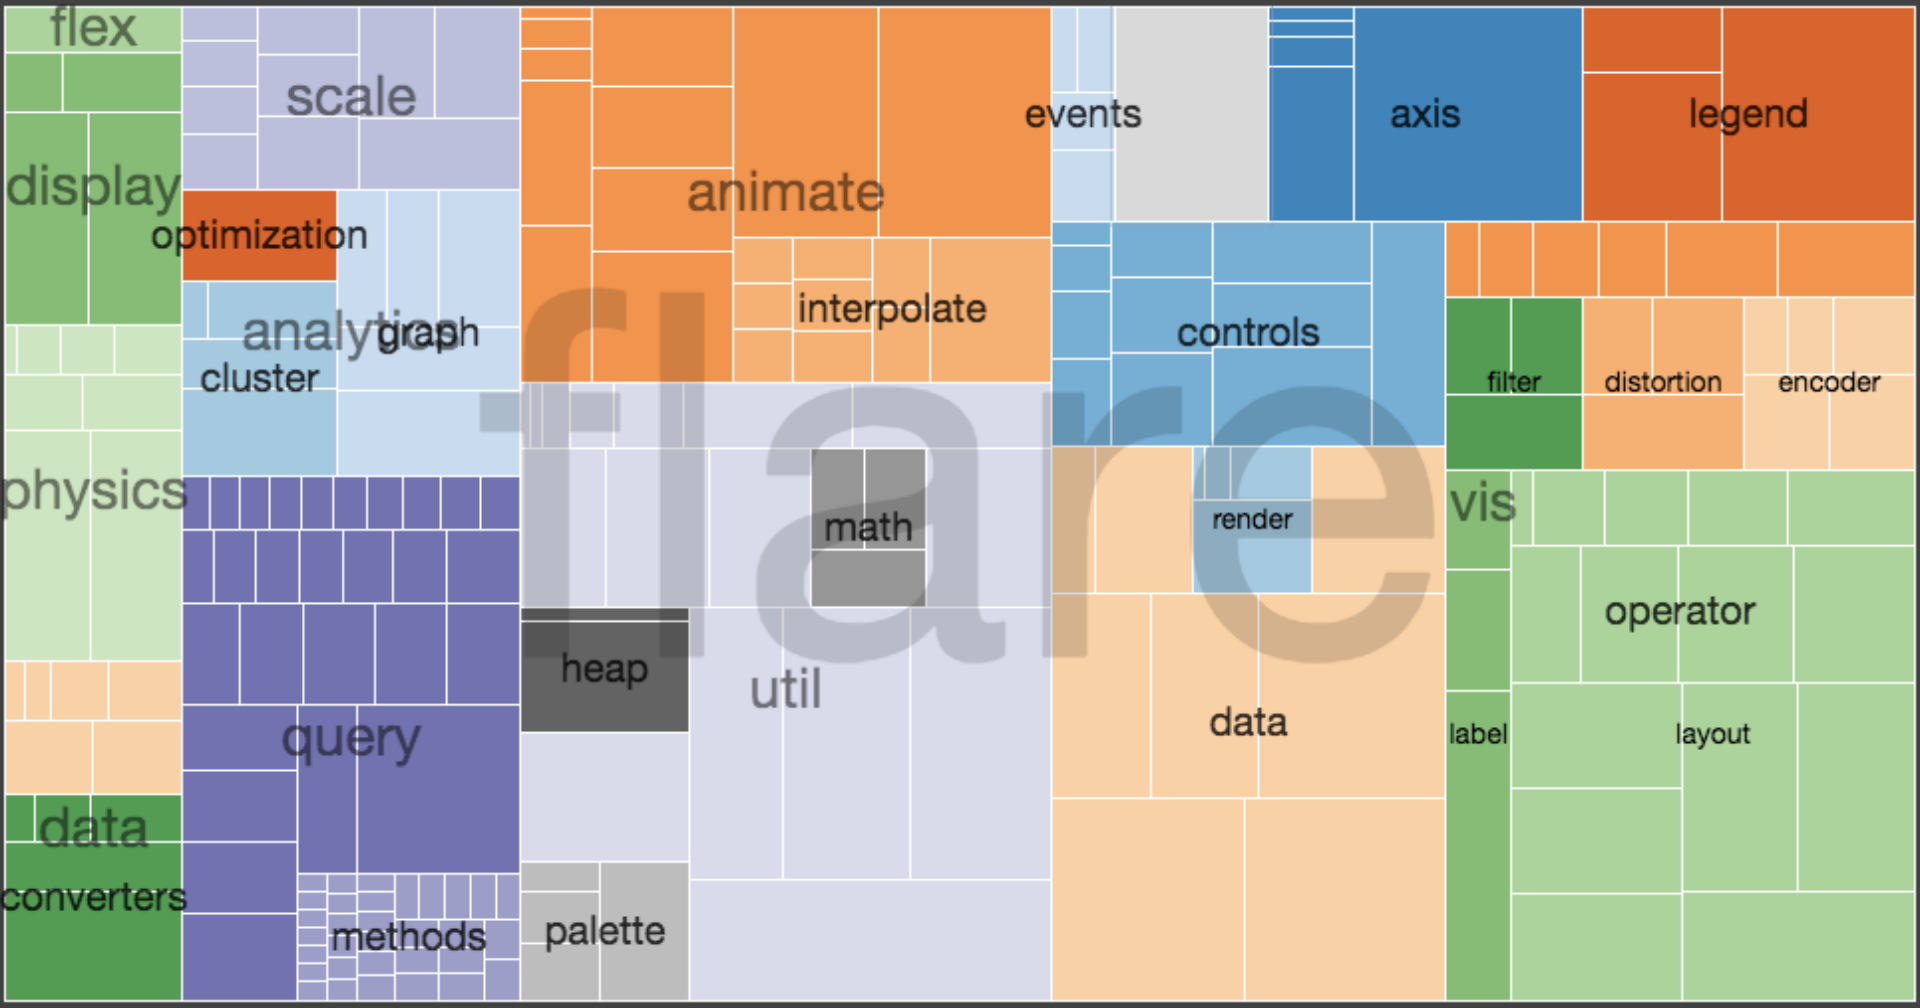
Posited Benefits of 1:1 Aspect Ratios

1. Minimize perimeter, reducing border ink.
   Mathematically true!

2. Easier to select with a mouse cursor.
   Validated by empirical research & Fitt’s Law!

3. ~~Similar aspect ratios are easier to compare.~~
   Extreme ratios & squares-only more inaccurate.
   Balanced ratios better? Target golden ratio?

Interactive Example…



What are **e**nclosure **d**iagrams good for?

Benefits

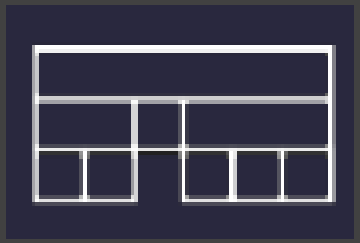
Provides a single view of an entire tree
Easier to spot large/small nodes
Estimation tasks, Attribute-based tasks

Problems

Difficult to accurately read structure / depth
Structure-based tasks, Browsing tasks

Layering

Layered Diagrams

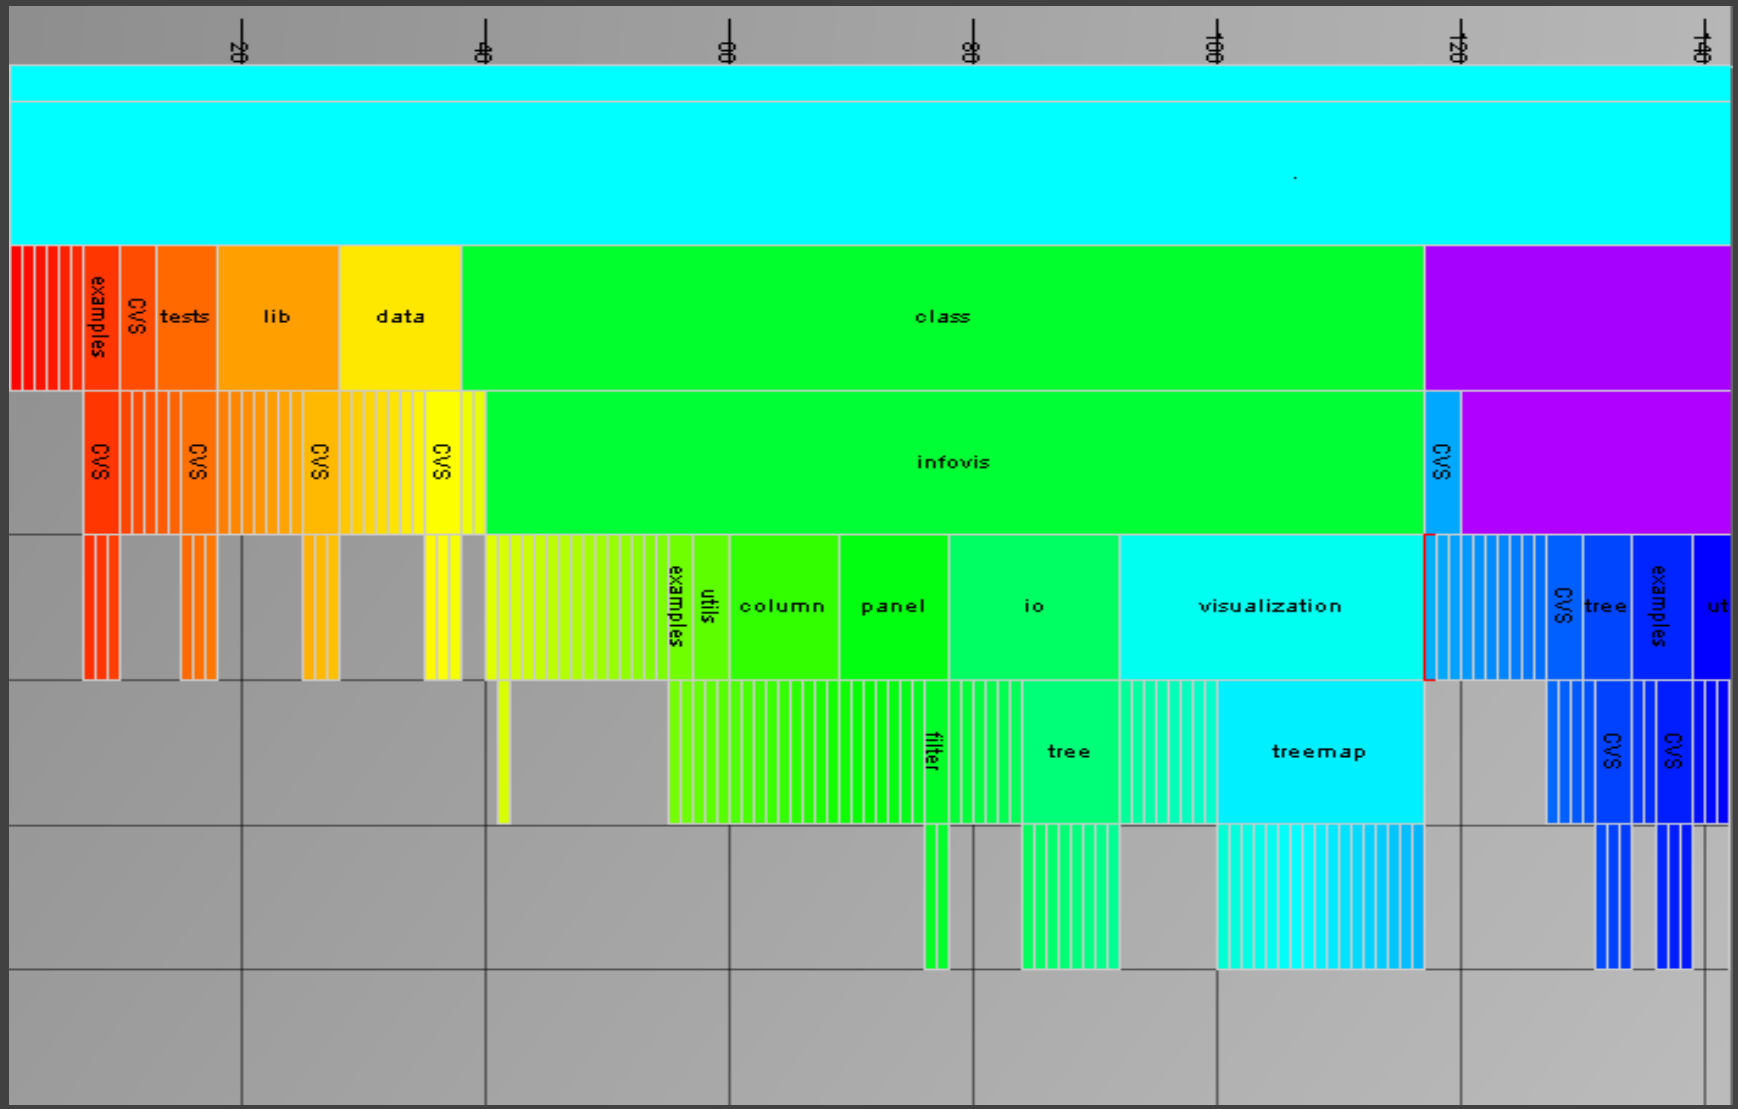


Signify tree structure using:
- Layering
- Adjacency
- Alignment

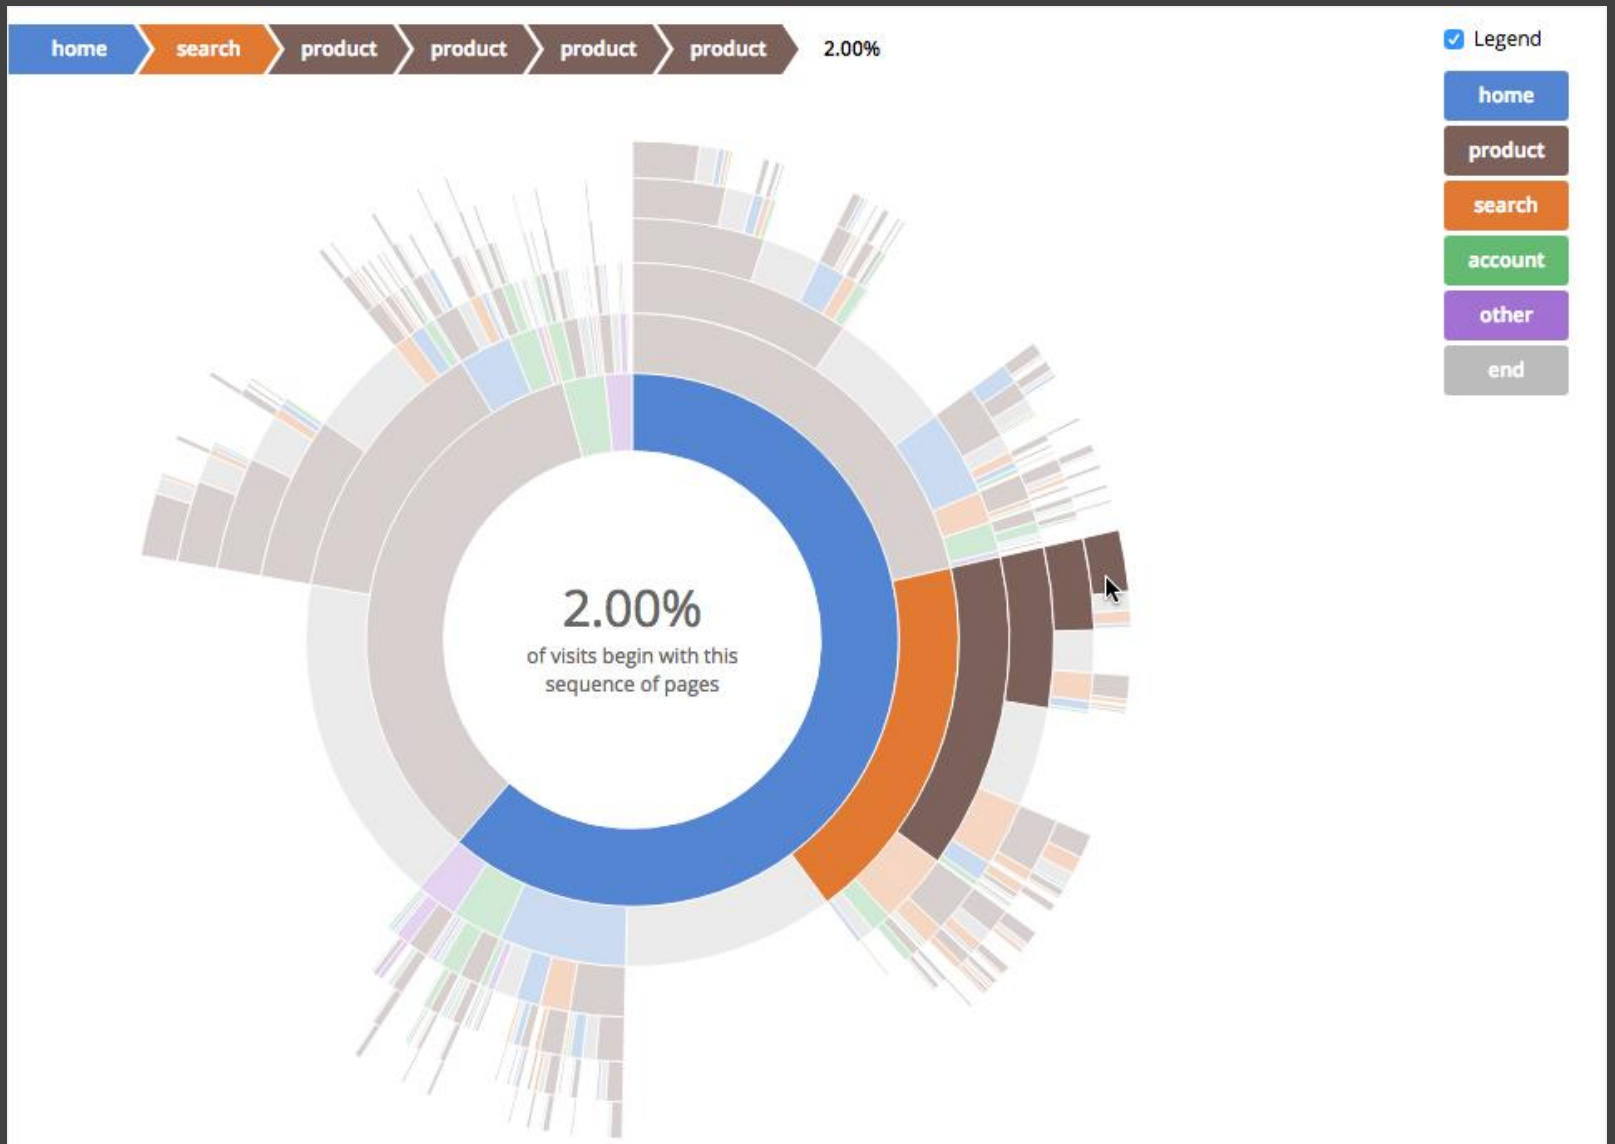
Involves recursive sub-division of space.

Leaf nodes may be sized by value, parent size visualizes sum of descendant leaf values.

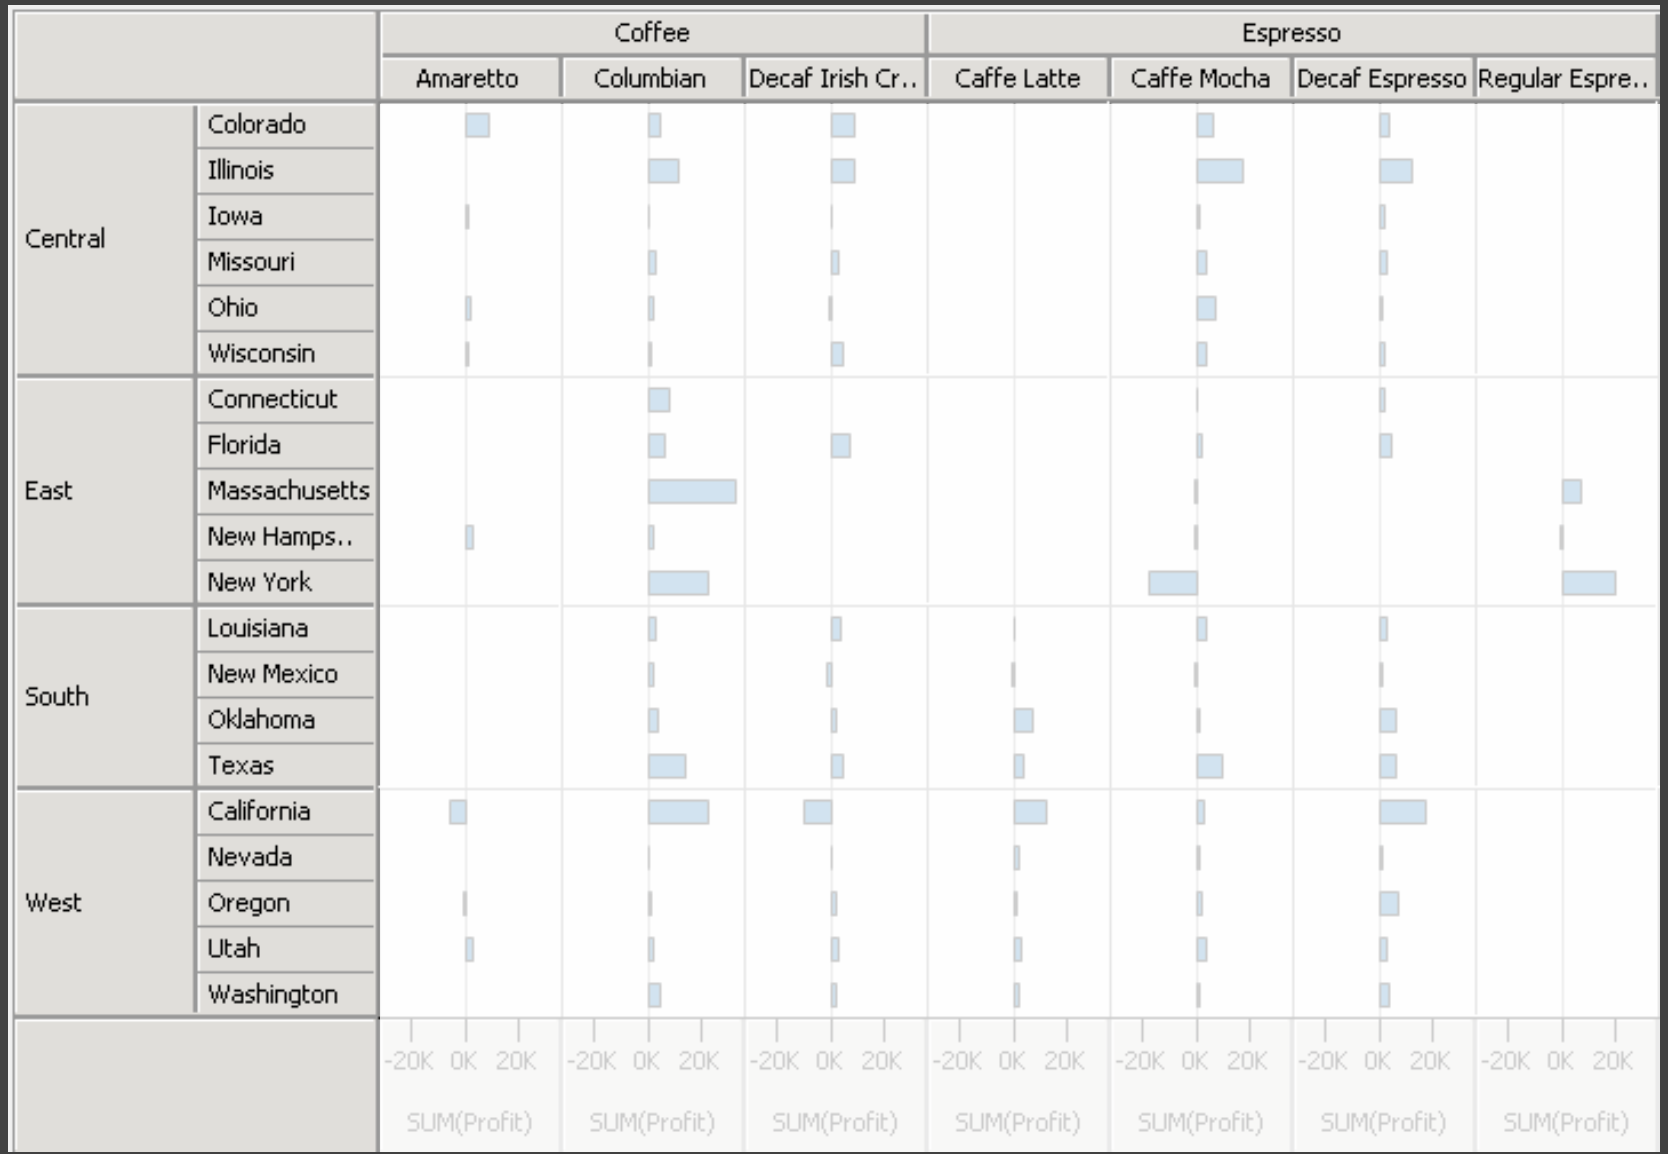
Icicle Trees: Cartesian Partition



“Sunburst” Trees: Polar Partition



Layered Trees Useful Elsewhere…



Administrivia

Final Project Schedule

No late days!!!

Proposal	***Wed Feb 19***
Prototype	*Tues Mar 4*
Demo Video	Tue Mar 11
Video Showcase	Thu Mar 13 (in class)
Deliverables	Tue Mar 18

Logistics

Final project description posted online

Work in groups of up to 4 people

Start determining your project topic!

Milestone Prototype

Publish work to Gitlab pages for us to examine and share feedback. You **are not** expected to have complete, polished content at this point.

You **are** expected to provide prototype work that communicates your design goals. For example: initial visualizations, sketches, storyboards, and text annotations / idea descriptions.

*We should get a sense of what you intend to ultimately submit! Also feel free to ask **us** questions.*

Node-Link Graph Layout

Node-Link Graph Visualization

Nodes connected by lines/curves

Arc Diagrams - aligned layout

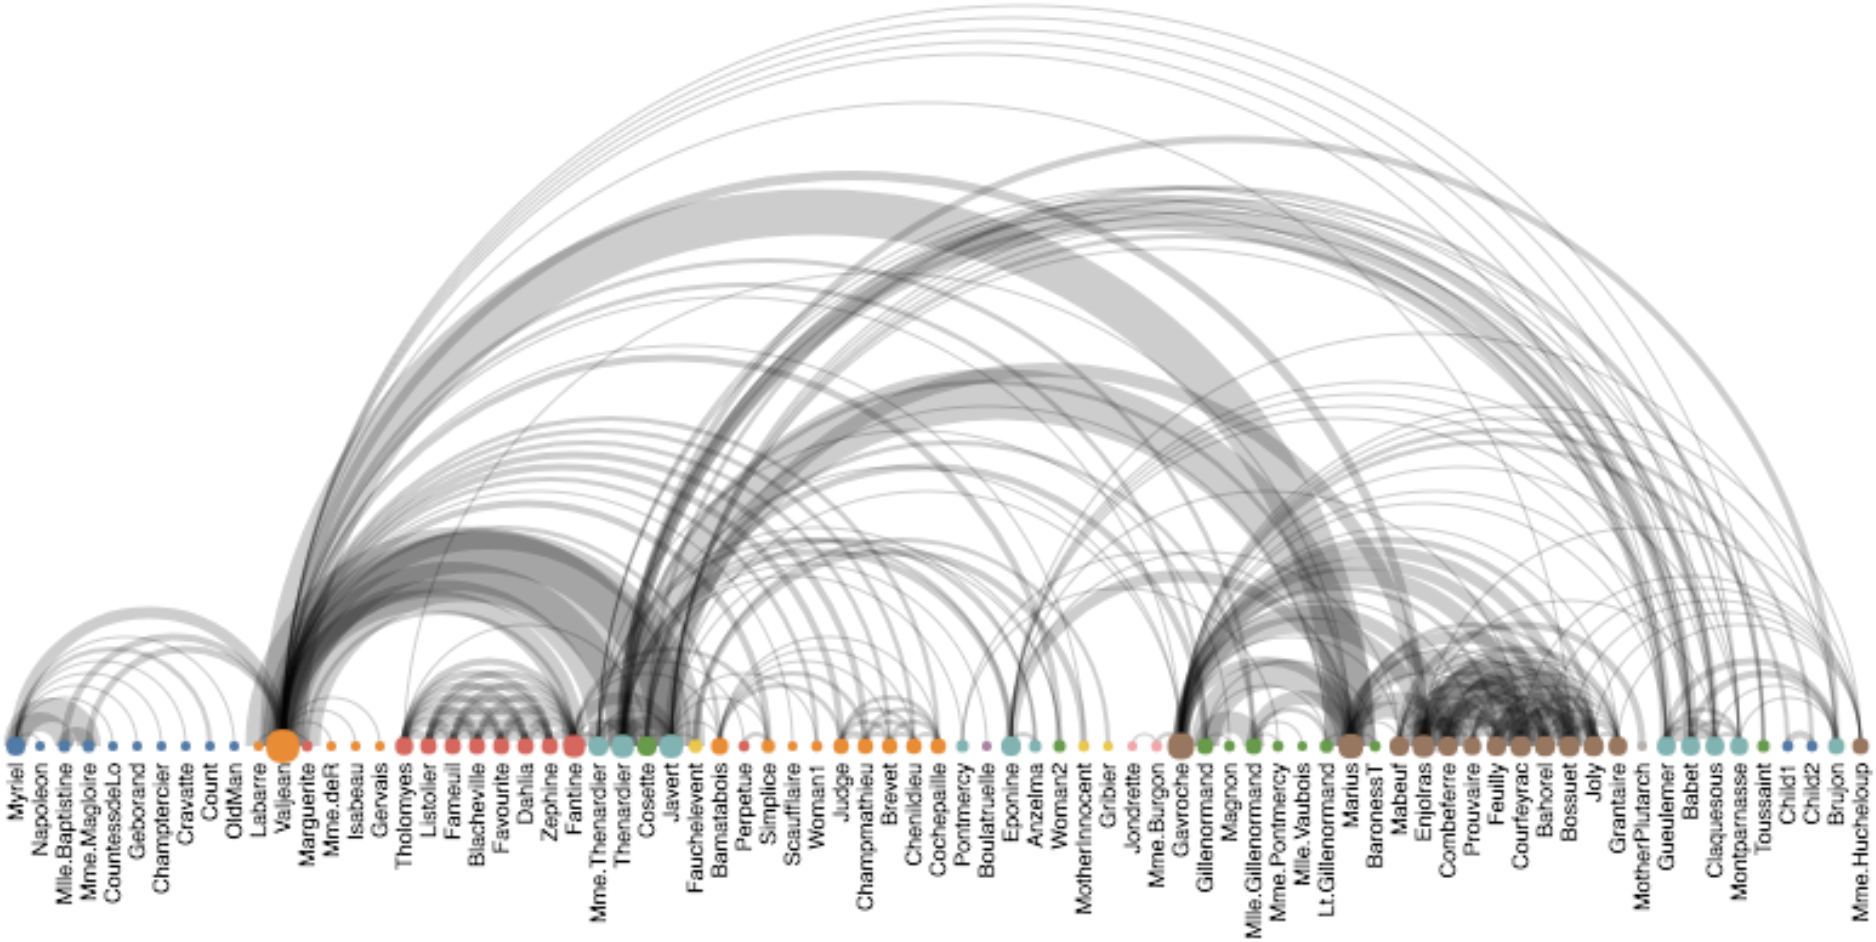
Sugiyama-Style Layout - arranged by depth

Force-Directed Layout - physical simulation

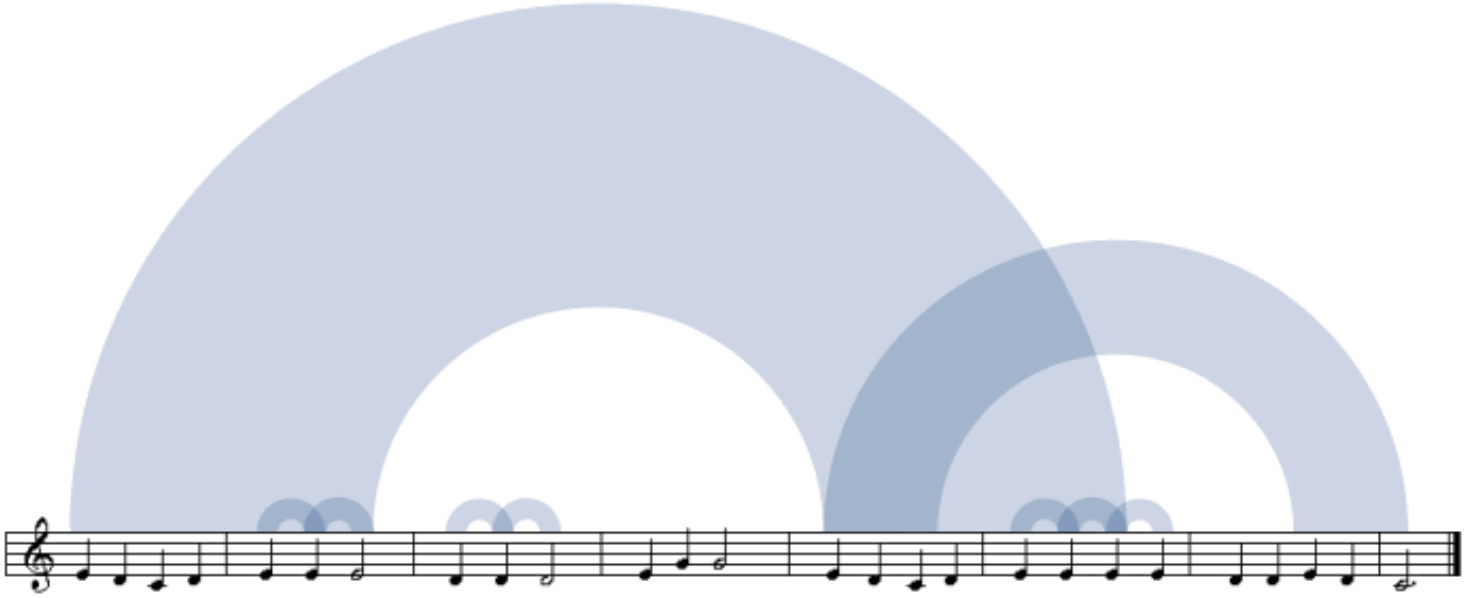
Attribute-Driven Layout - arranged by value

Constraint-Based Layout - optimization

Arc Diagrams



Linear node layout, circular arcs show connections.
Layout quality sensitive to node ordering!



For example, the picture above was built from the first line of a very simple piece: *Mary Had a Little Lamb*. Each arch connects two identical passages. To clarify the connection between the visualization and the song, in this diagram the score is displayed beneath the arches.

The Shape of Song

[Wattenberg ’01]

This diagram visualizes the refrain from the folk song *Clementine*. As you would expect, the refrain consists of multiple repetitions of the same passage--and that is exactly what the diagram shows. The score isn't shown in this diagram since the notes would be too small to read.

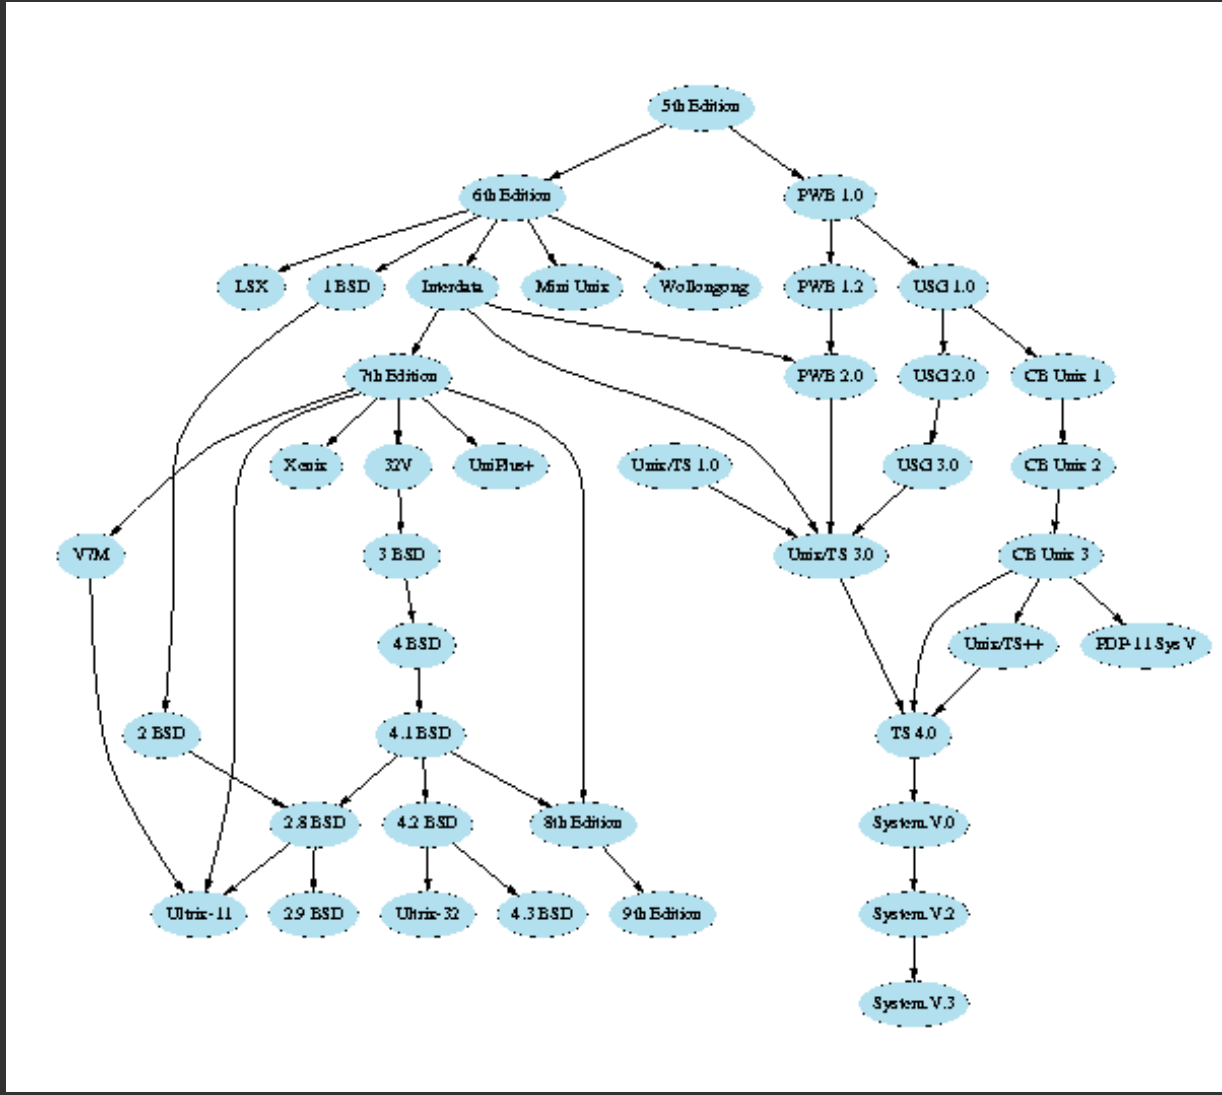
Sugiyama-Style Layout

Sugiyama-Style Layout

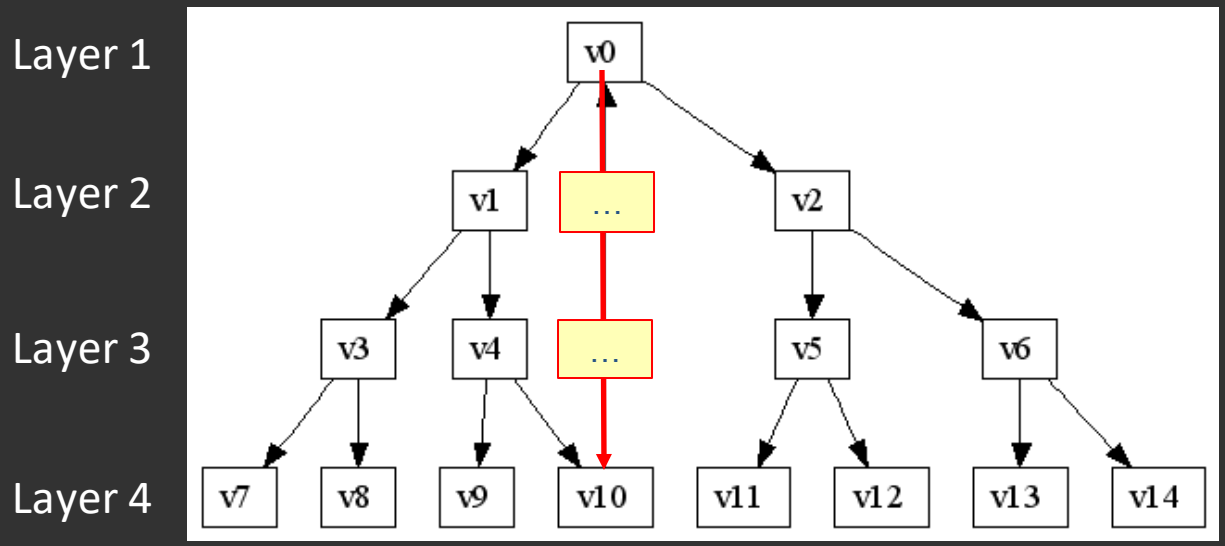
Evolution of the UNIX operating system

Hierarchical layering based on descent

GraphViz package!



Sugiyama-Style Layout



Reverse edges to remove cycles

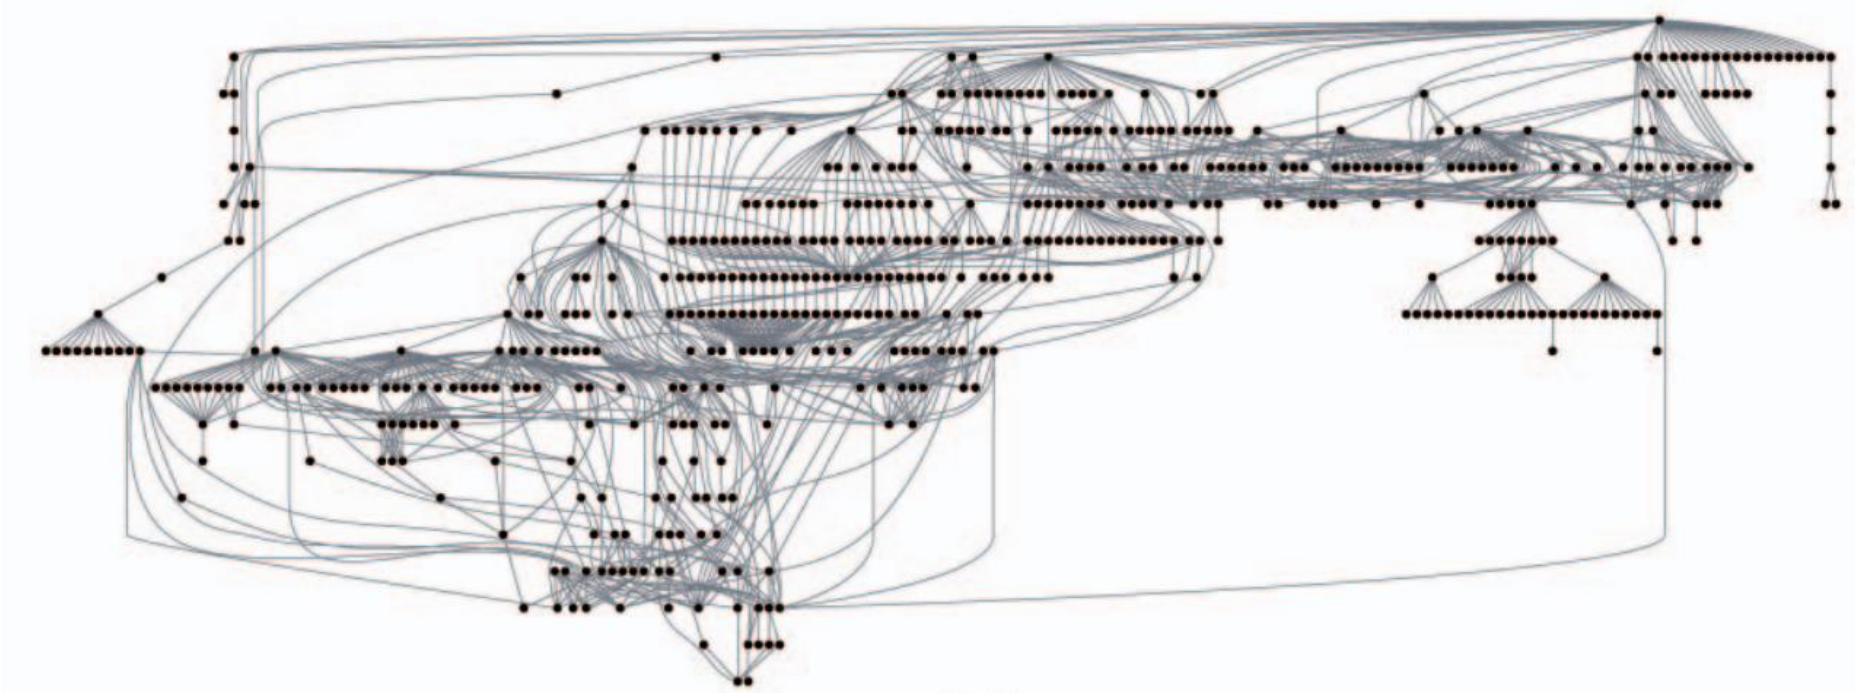
Assign nodes to hierarchy layers

Create dummy nodes to “fill in” missing layers

Arrange nodes within layer, minimize edge crossings

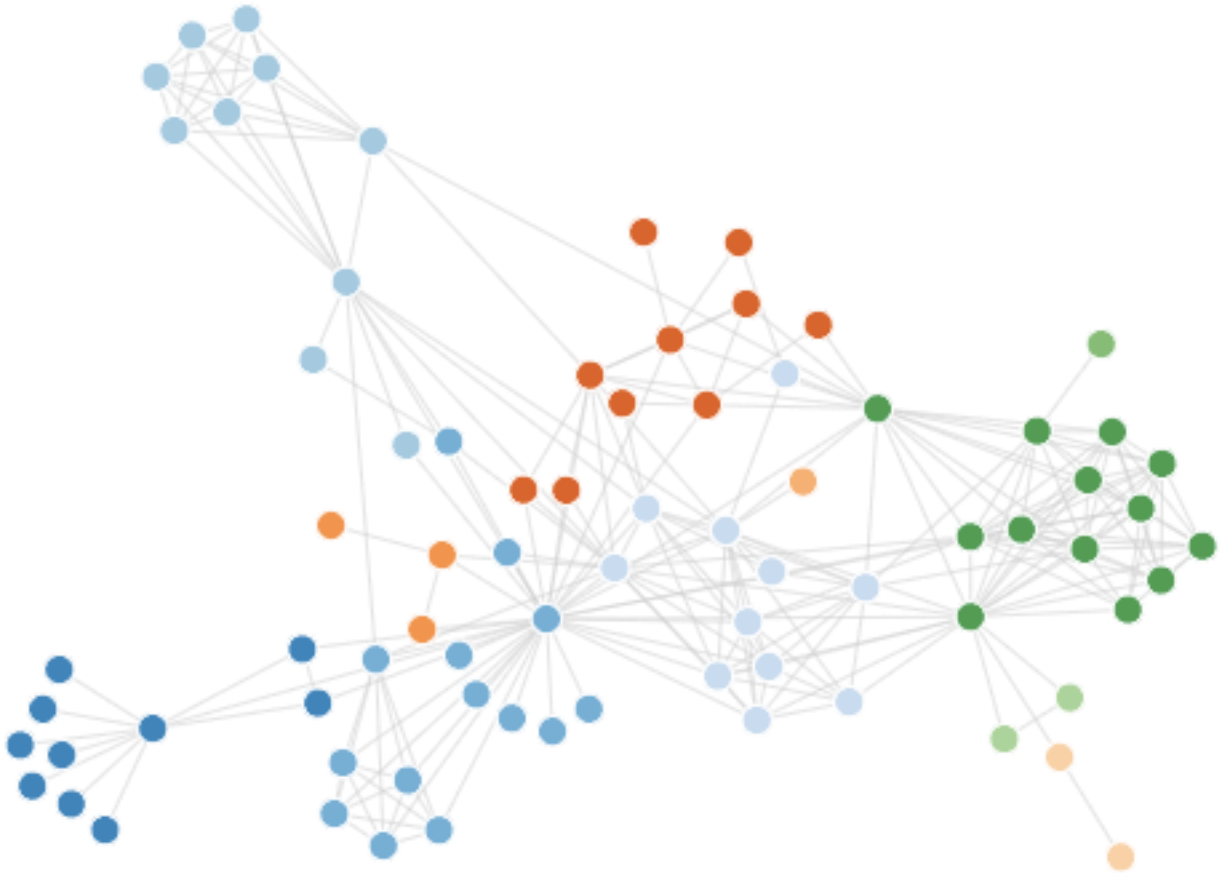
Route edges – layout splines if needed

Produces Hierarchical Layouts



Sugiyama-style layout emphasizes hierarchy.
However, cycles in the graph may mislead.
Long edges can impede perception of proximity.

Force-Directed Layout



Interactive Example: Configurable Force Layout

About	[Some know me as danah...] I'm a geek, an activist and an academic, fascinated by people and society. I see life as a very large playground and enjoy exploring its intricacies. I revel in life's chaos, while simultaneously providing my own insane element. My musings: http://www.zephoria.org/thoughts/
Want to Meet	Someone who makes life's complexities seem simply elegant

Use the Force!

http://mbostock.github.io/d3/talk/20110921/

Layout by Physics Simulation

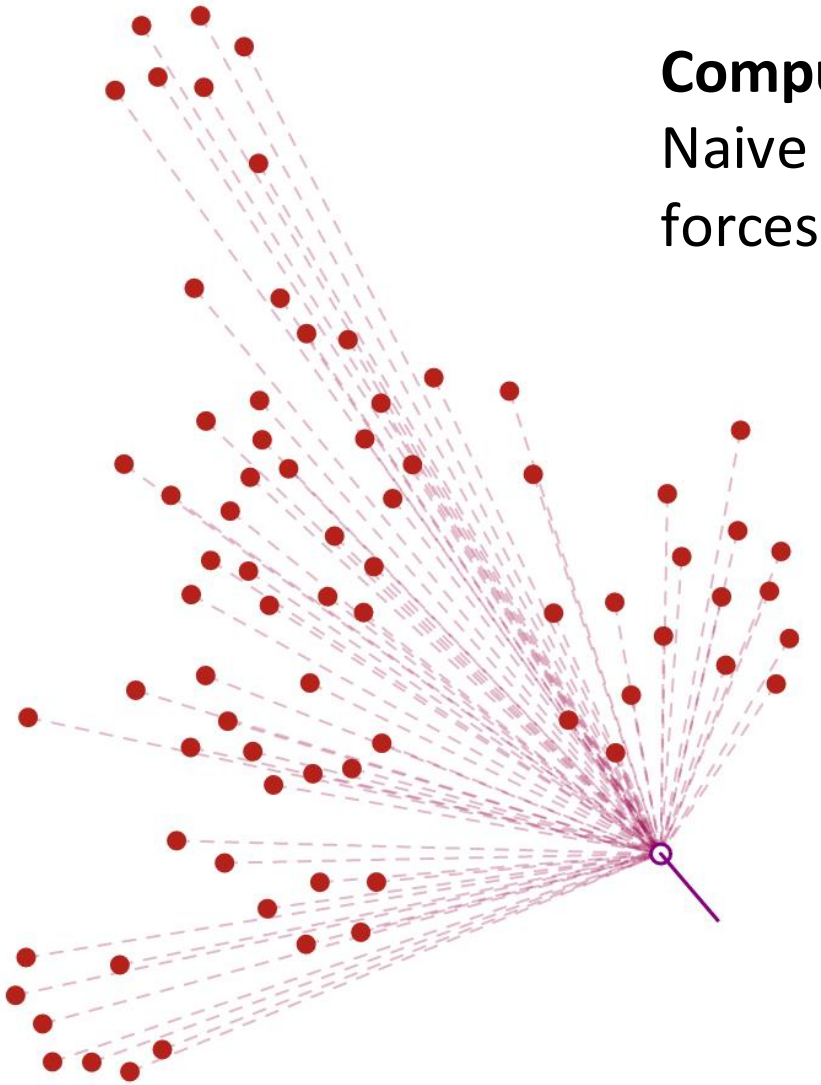
Nodes = charged particles $F = q_i * q_j / d_{ij}^2$

with air resistance $F = -b * v_i$

Edges = springs $F = k * (L - d_{ij})$

At each timestep, calculate forces acting on nodes.
Integrate for updated velocities and positions.

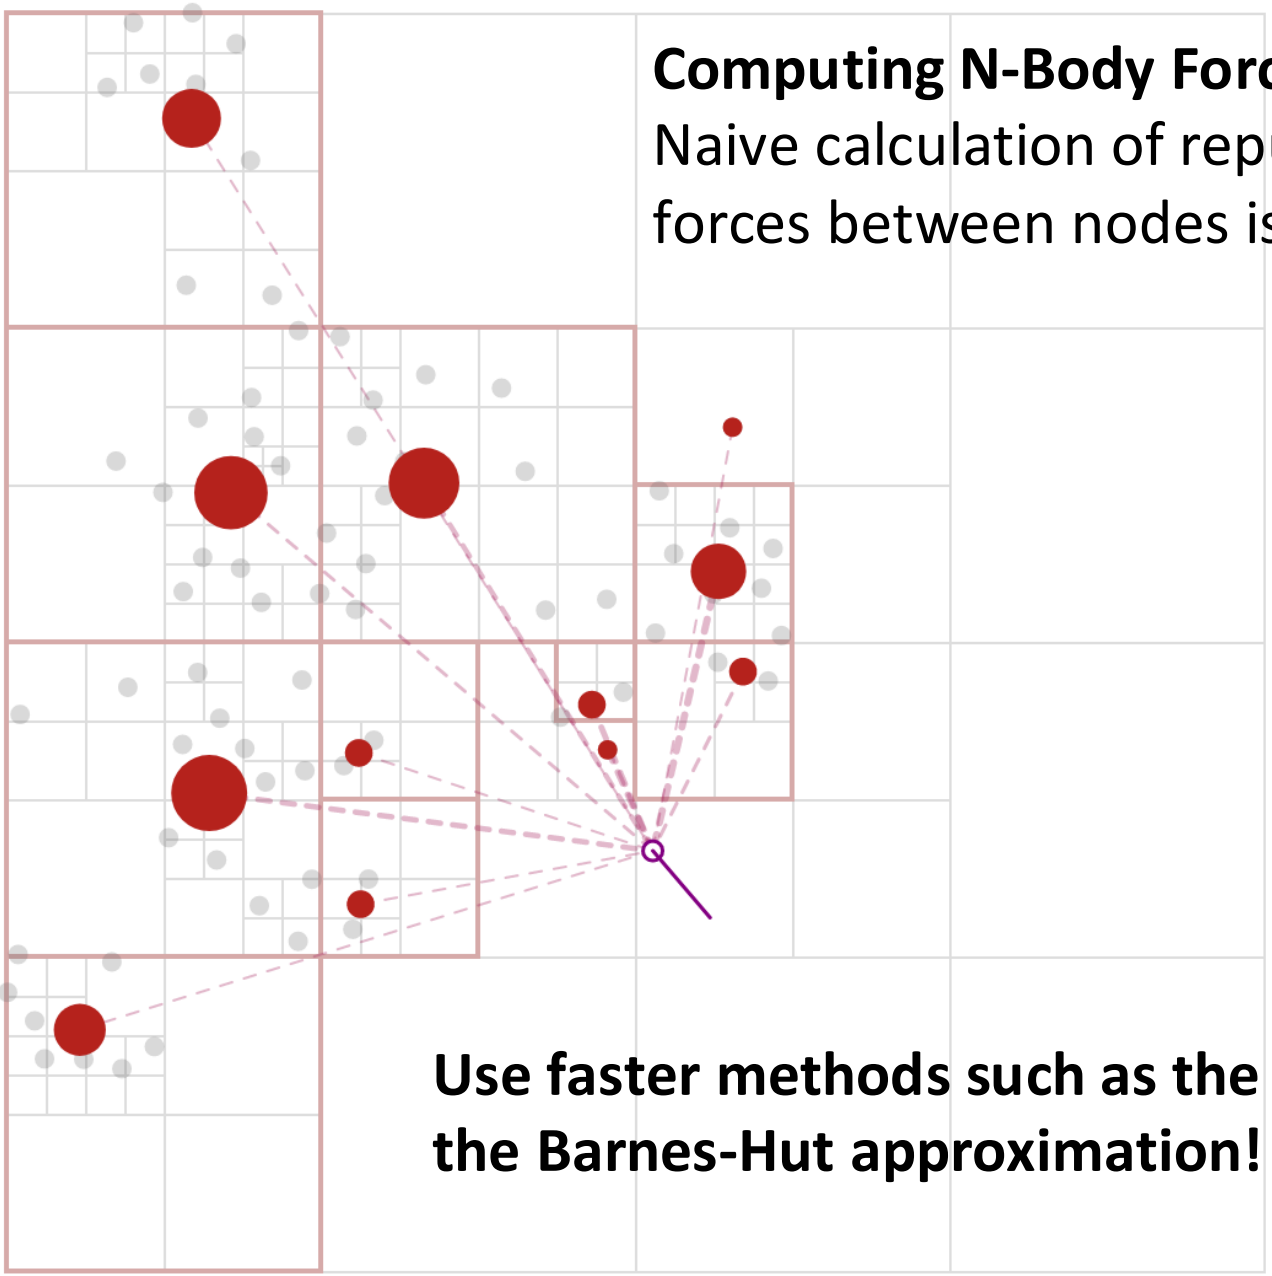
D3's force layout uses **velocity Verlet** integration.
Assume uniform mass ***m*** and timestep ***Δt***:
$F = ma \rightarrow F = a \rightarrow F = \Delta v / \Delta t \rightarrow F = \Delta v$
Forces simplify to velocity offsets!



Computing N-Body Forces

Naive calculation of repulsive forces between nodes is $O(n^2)$

Naive calculation of forces at a point uses sum of forces from all other n-1 points.



Computing N-Body Forces

Naive calculation of repulsive forces between nodes is $O(n^2)$

Use faster methods such as the the Barnes-Hut approximation!

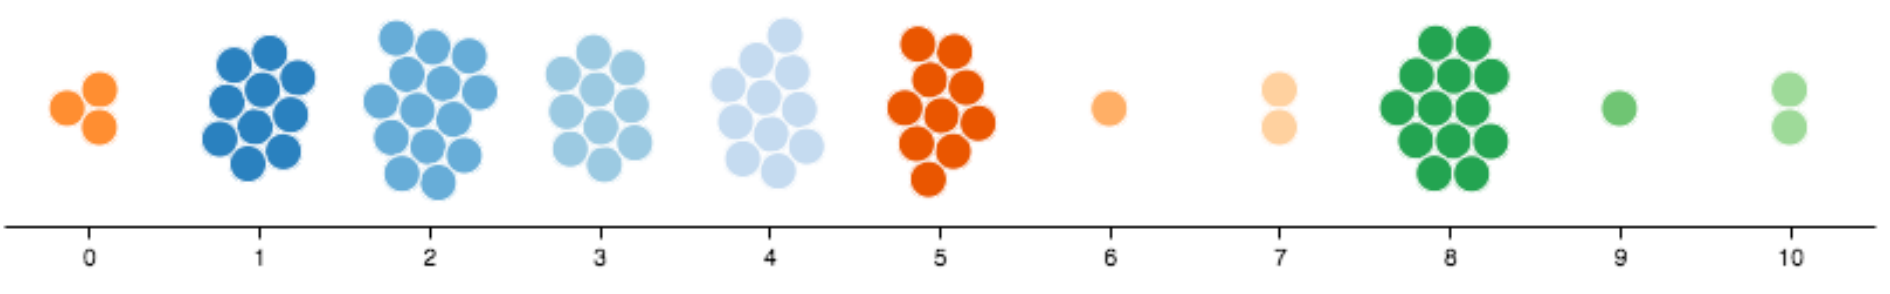
Customized Force Layouts

Different forces can be composed to create an expressive space of custom layouts.

A **beeswarm plot** can be made by combining:

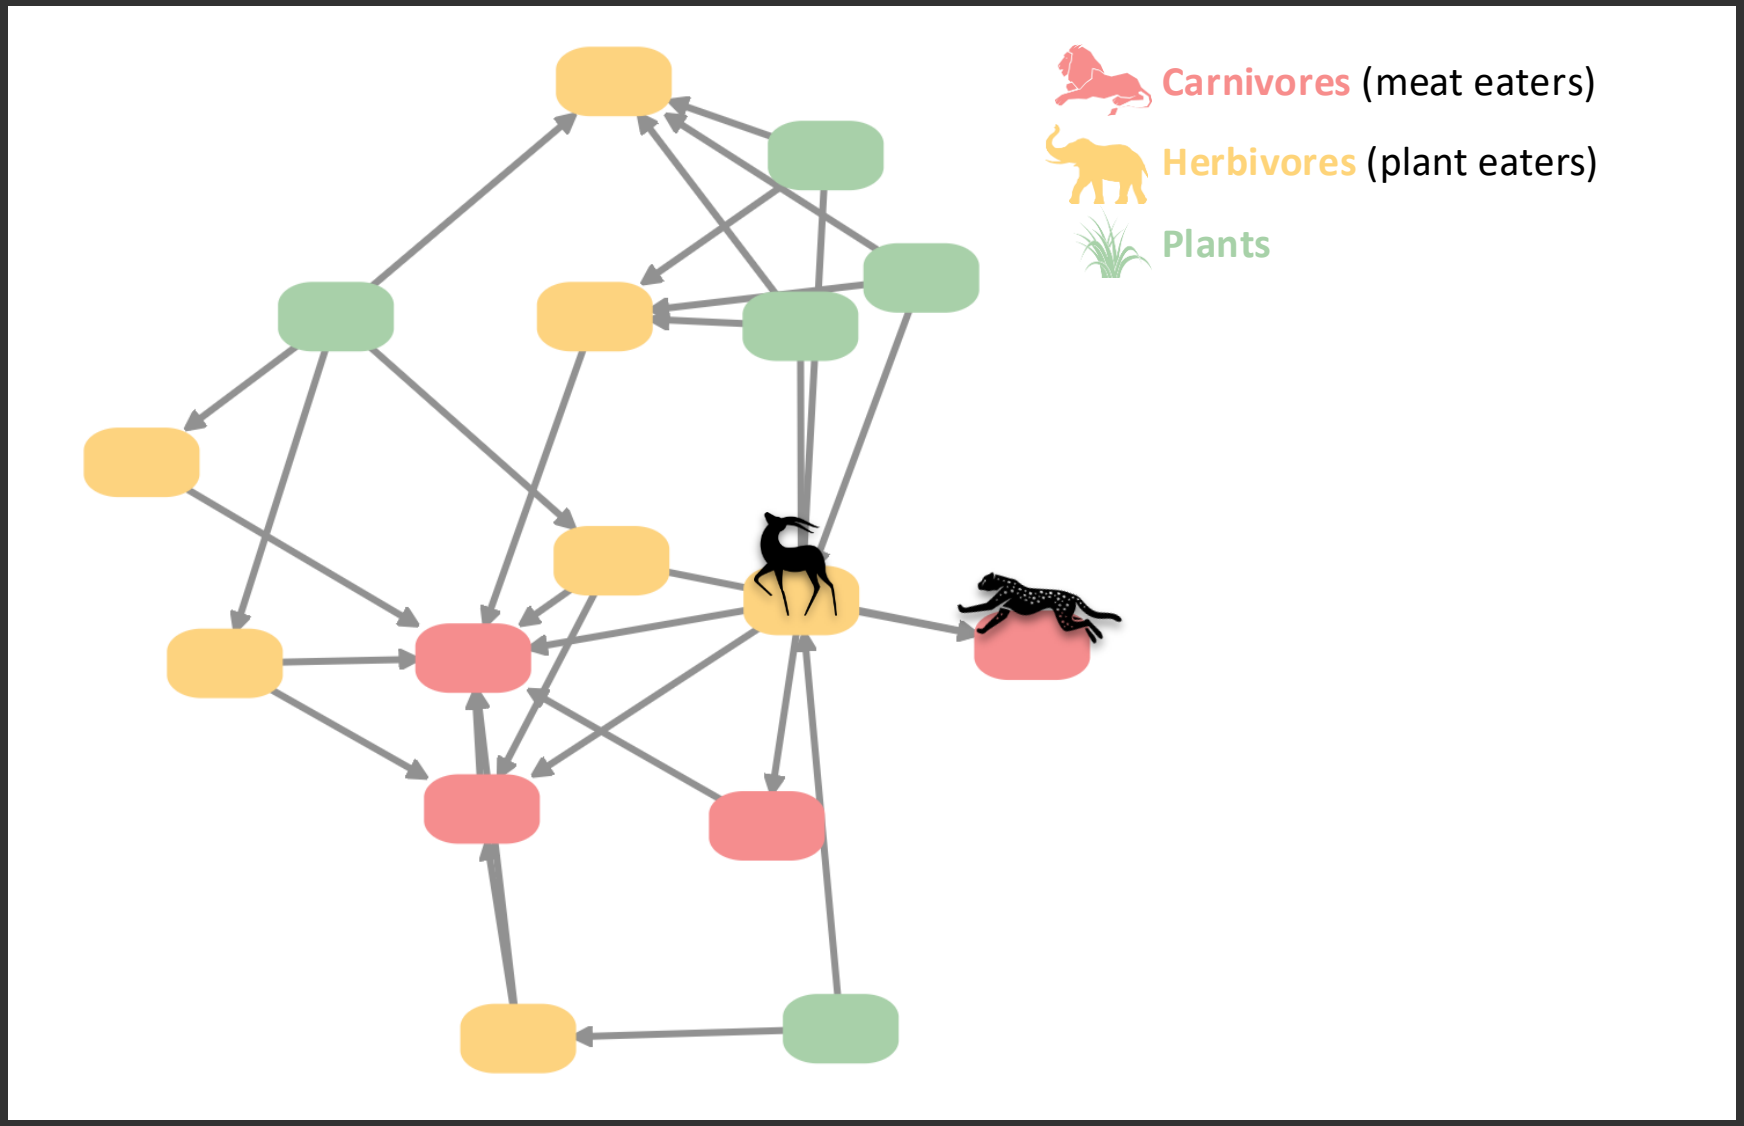
Attractive **X** and **Y** forces to draw nodes of a certain category to a desired point

Collide force to detect collision & remove overlap

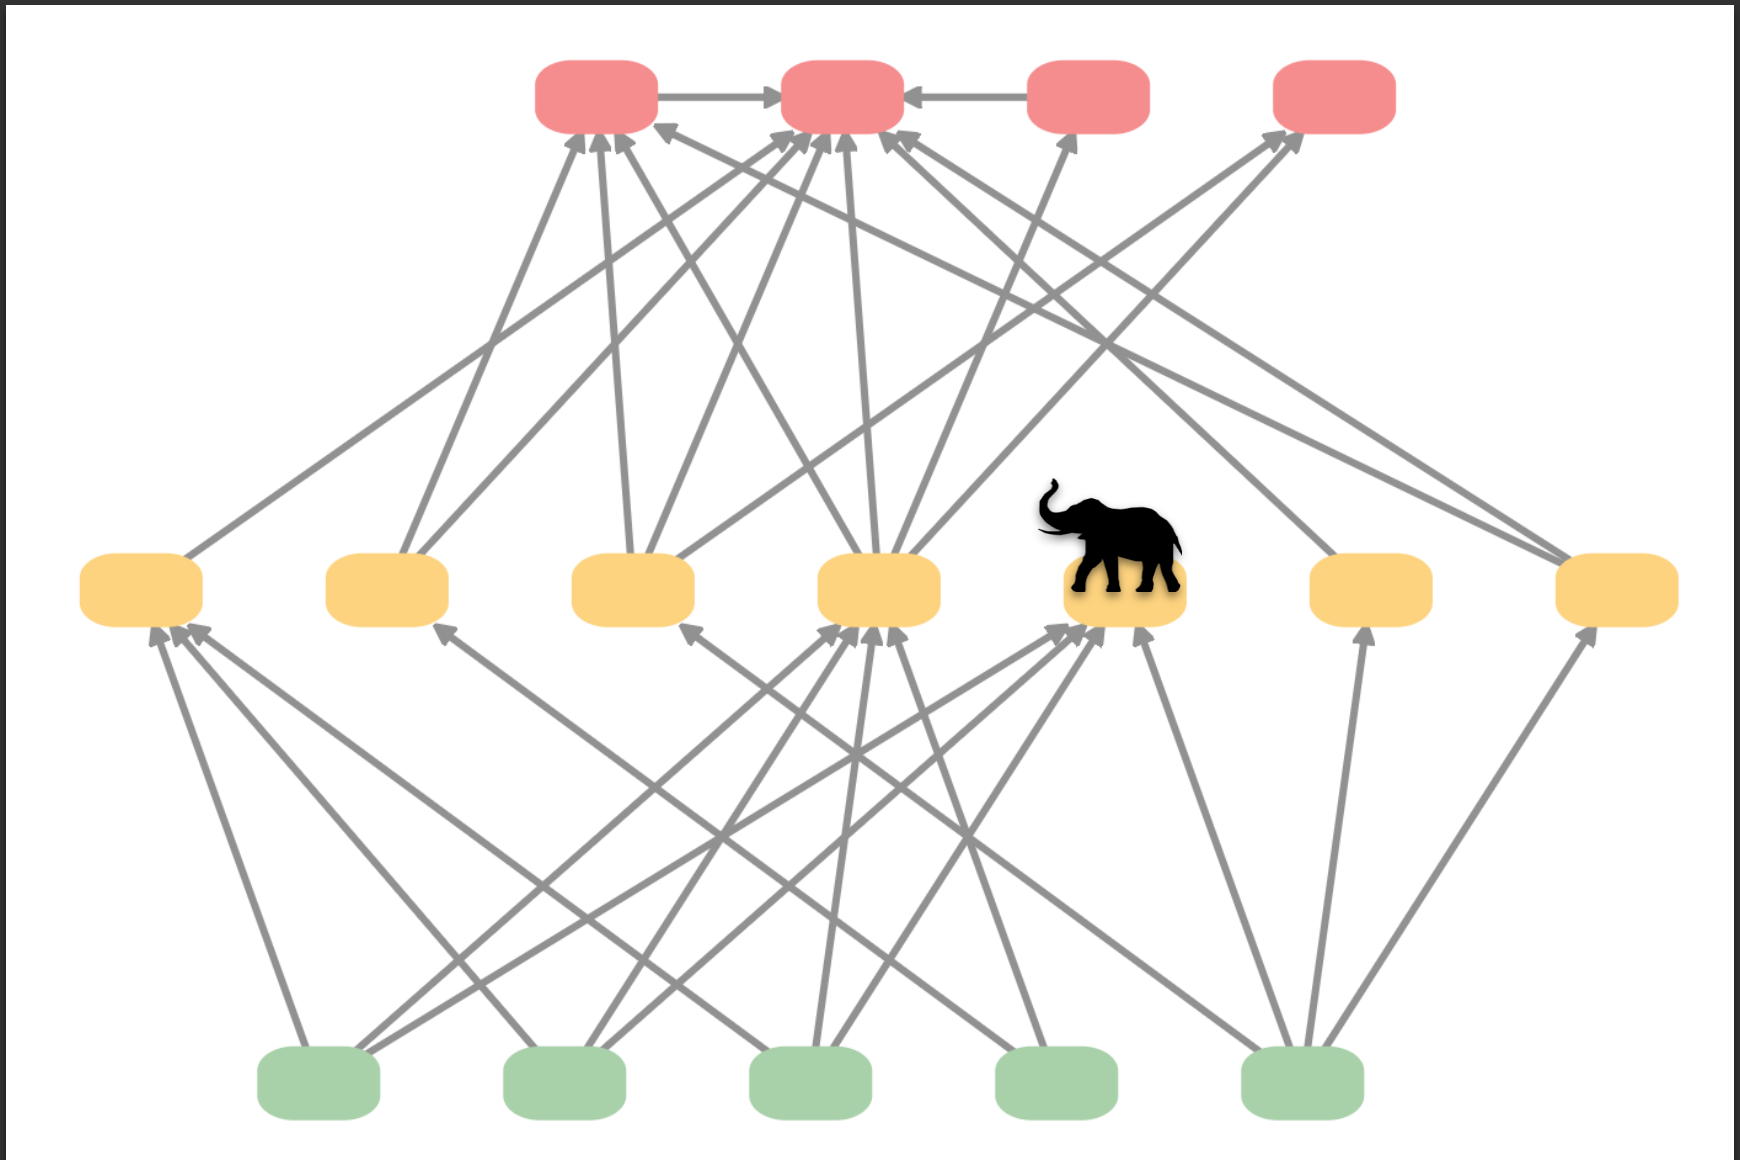


Attribute-Driven Layout

How many herbivores have no predators?



How many herbivores have no predators?



Attribute-Driven Layout

Large node-link diagrams **get messy**!

Is there additional structure we can exploit?
Idea: Use **data attributes** to perform layout

For example, scatter plot based on node values
Attributes may be associated with nodes or edges

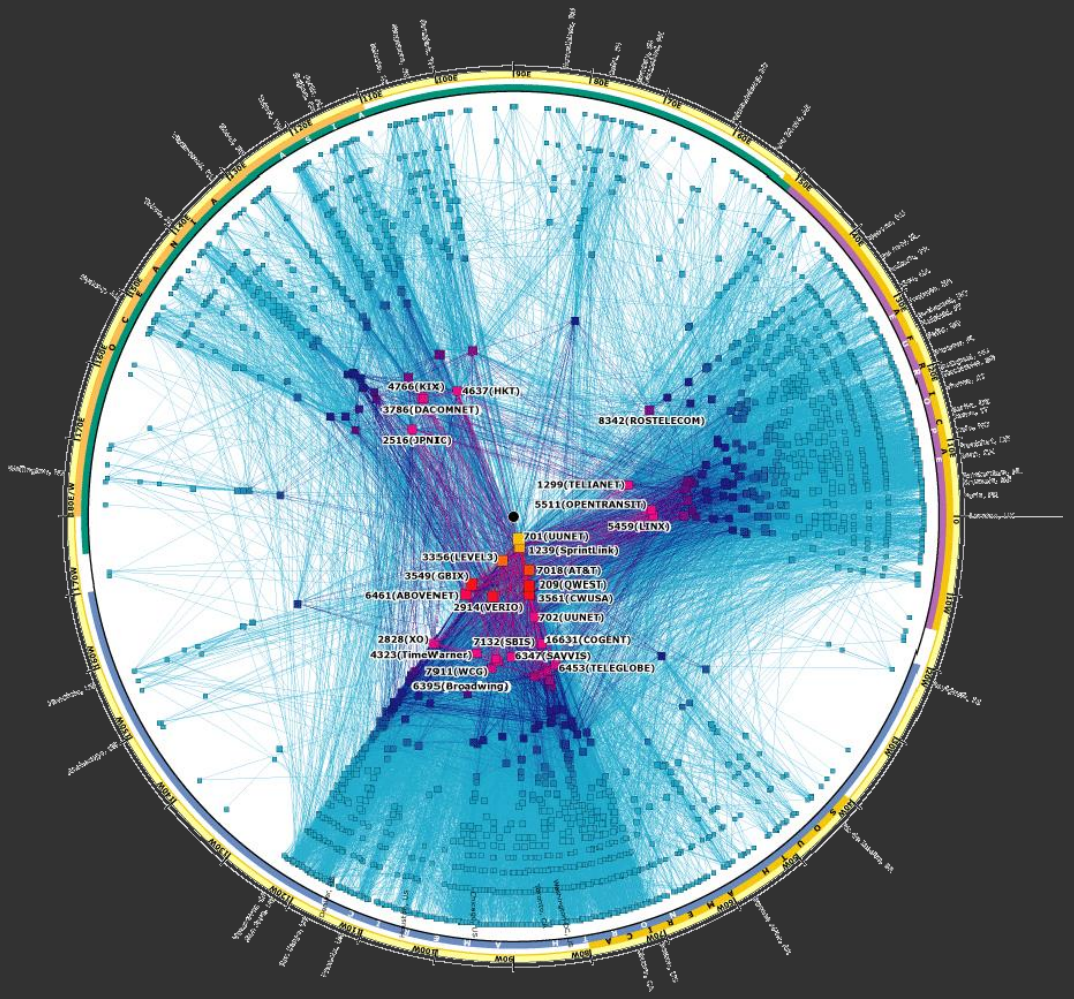
or may be statistical properties of the graph.
Use dynamic queries / brushing to explore…

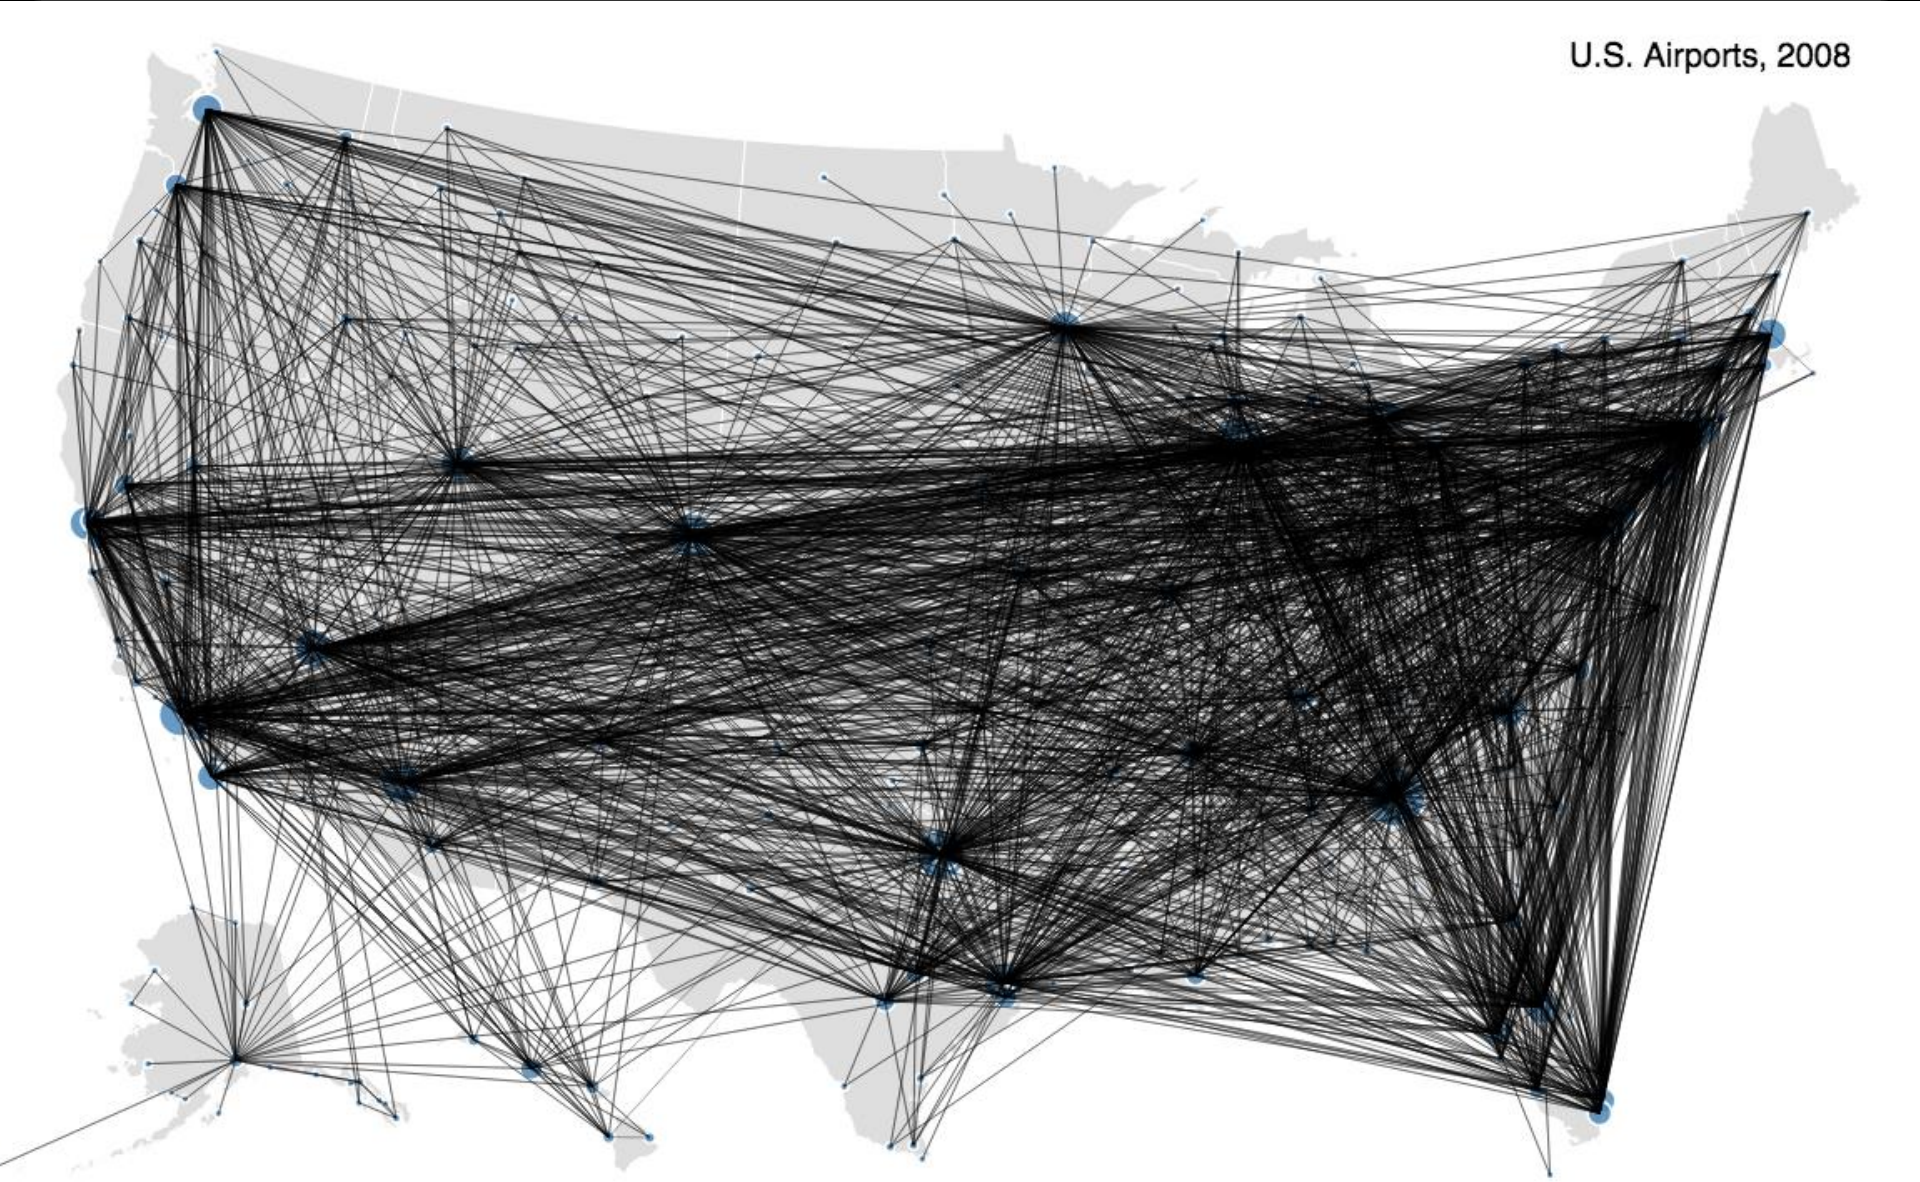
Attribute-Driven Layout

The “Skitter” Layout
Internet Connectivity
Radial Scatterplot

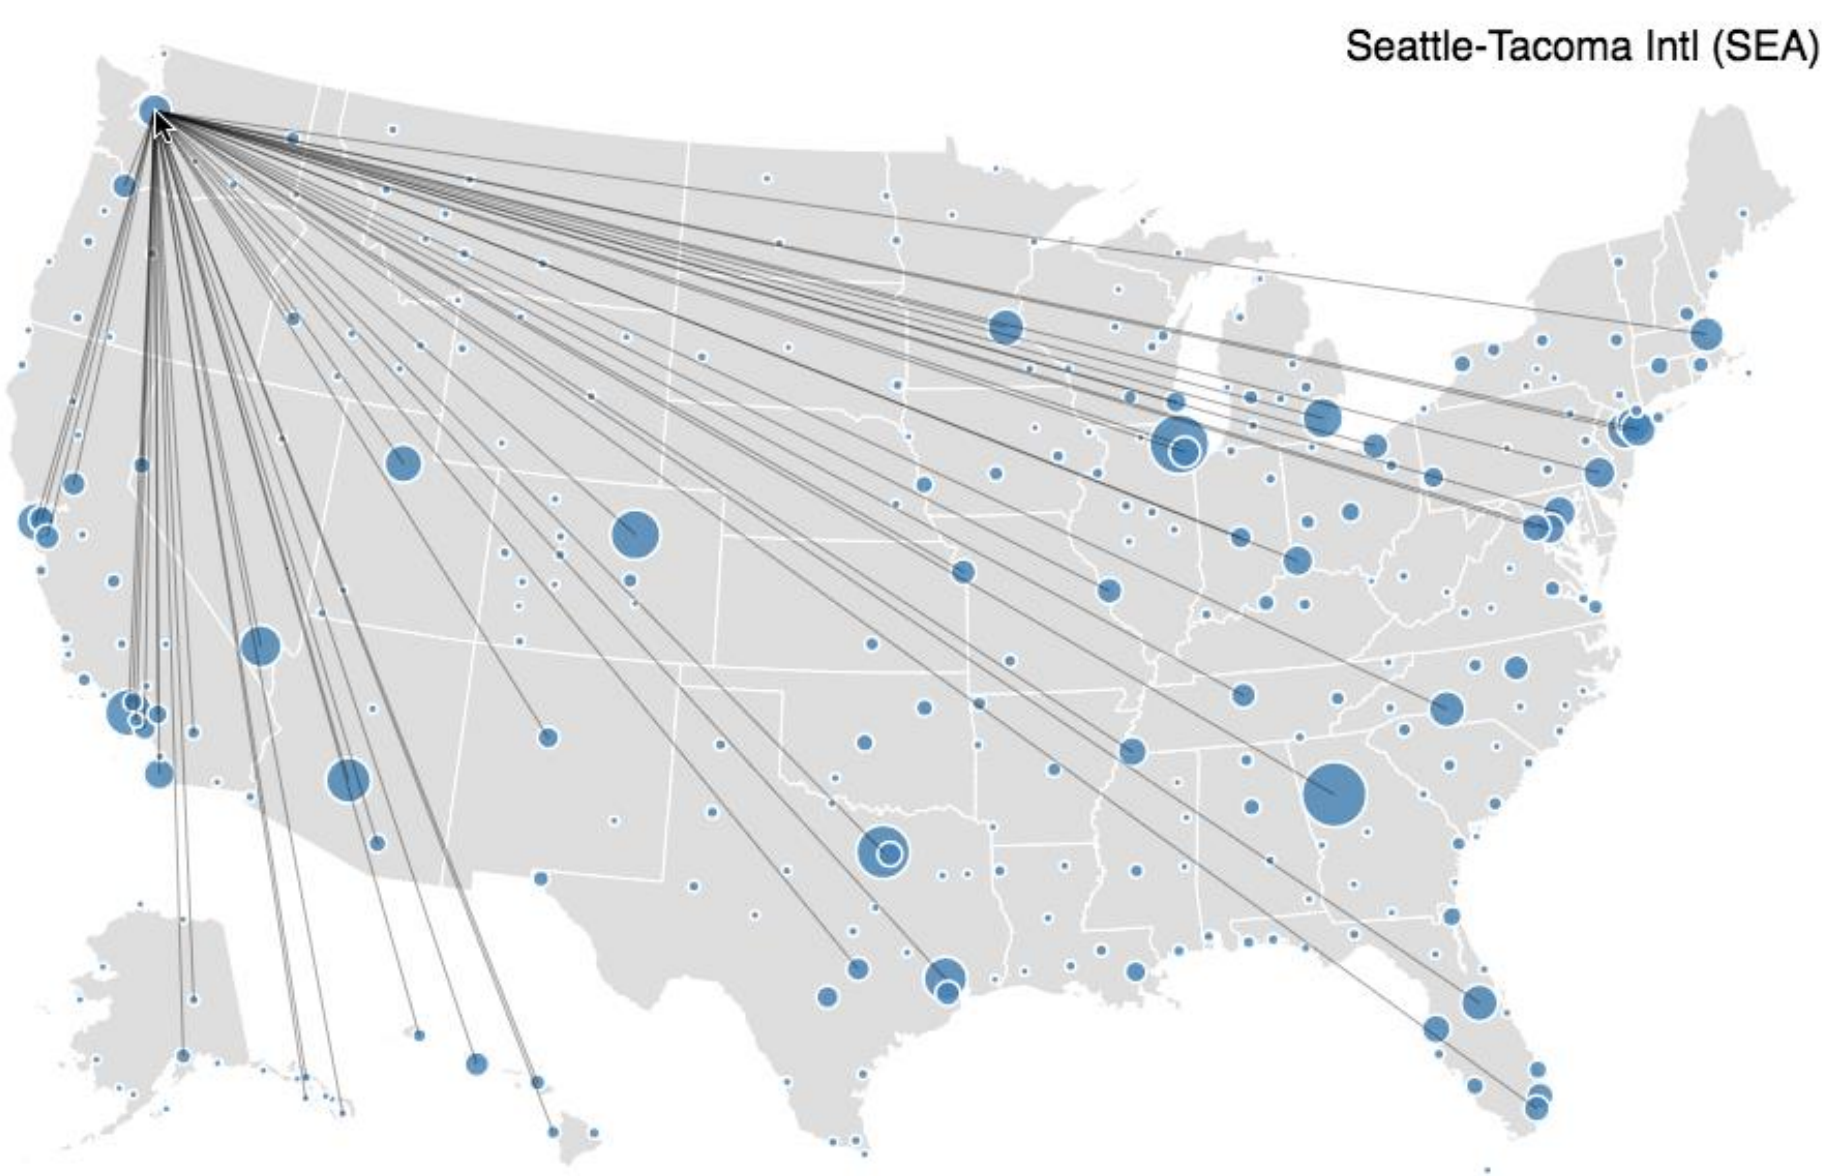
Angle = Longitude
Geography

Radius = Degree
# of connections
(a statistic of the nodes)



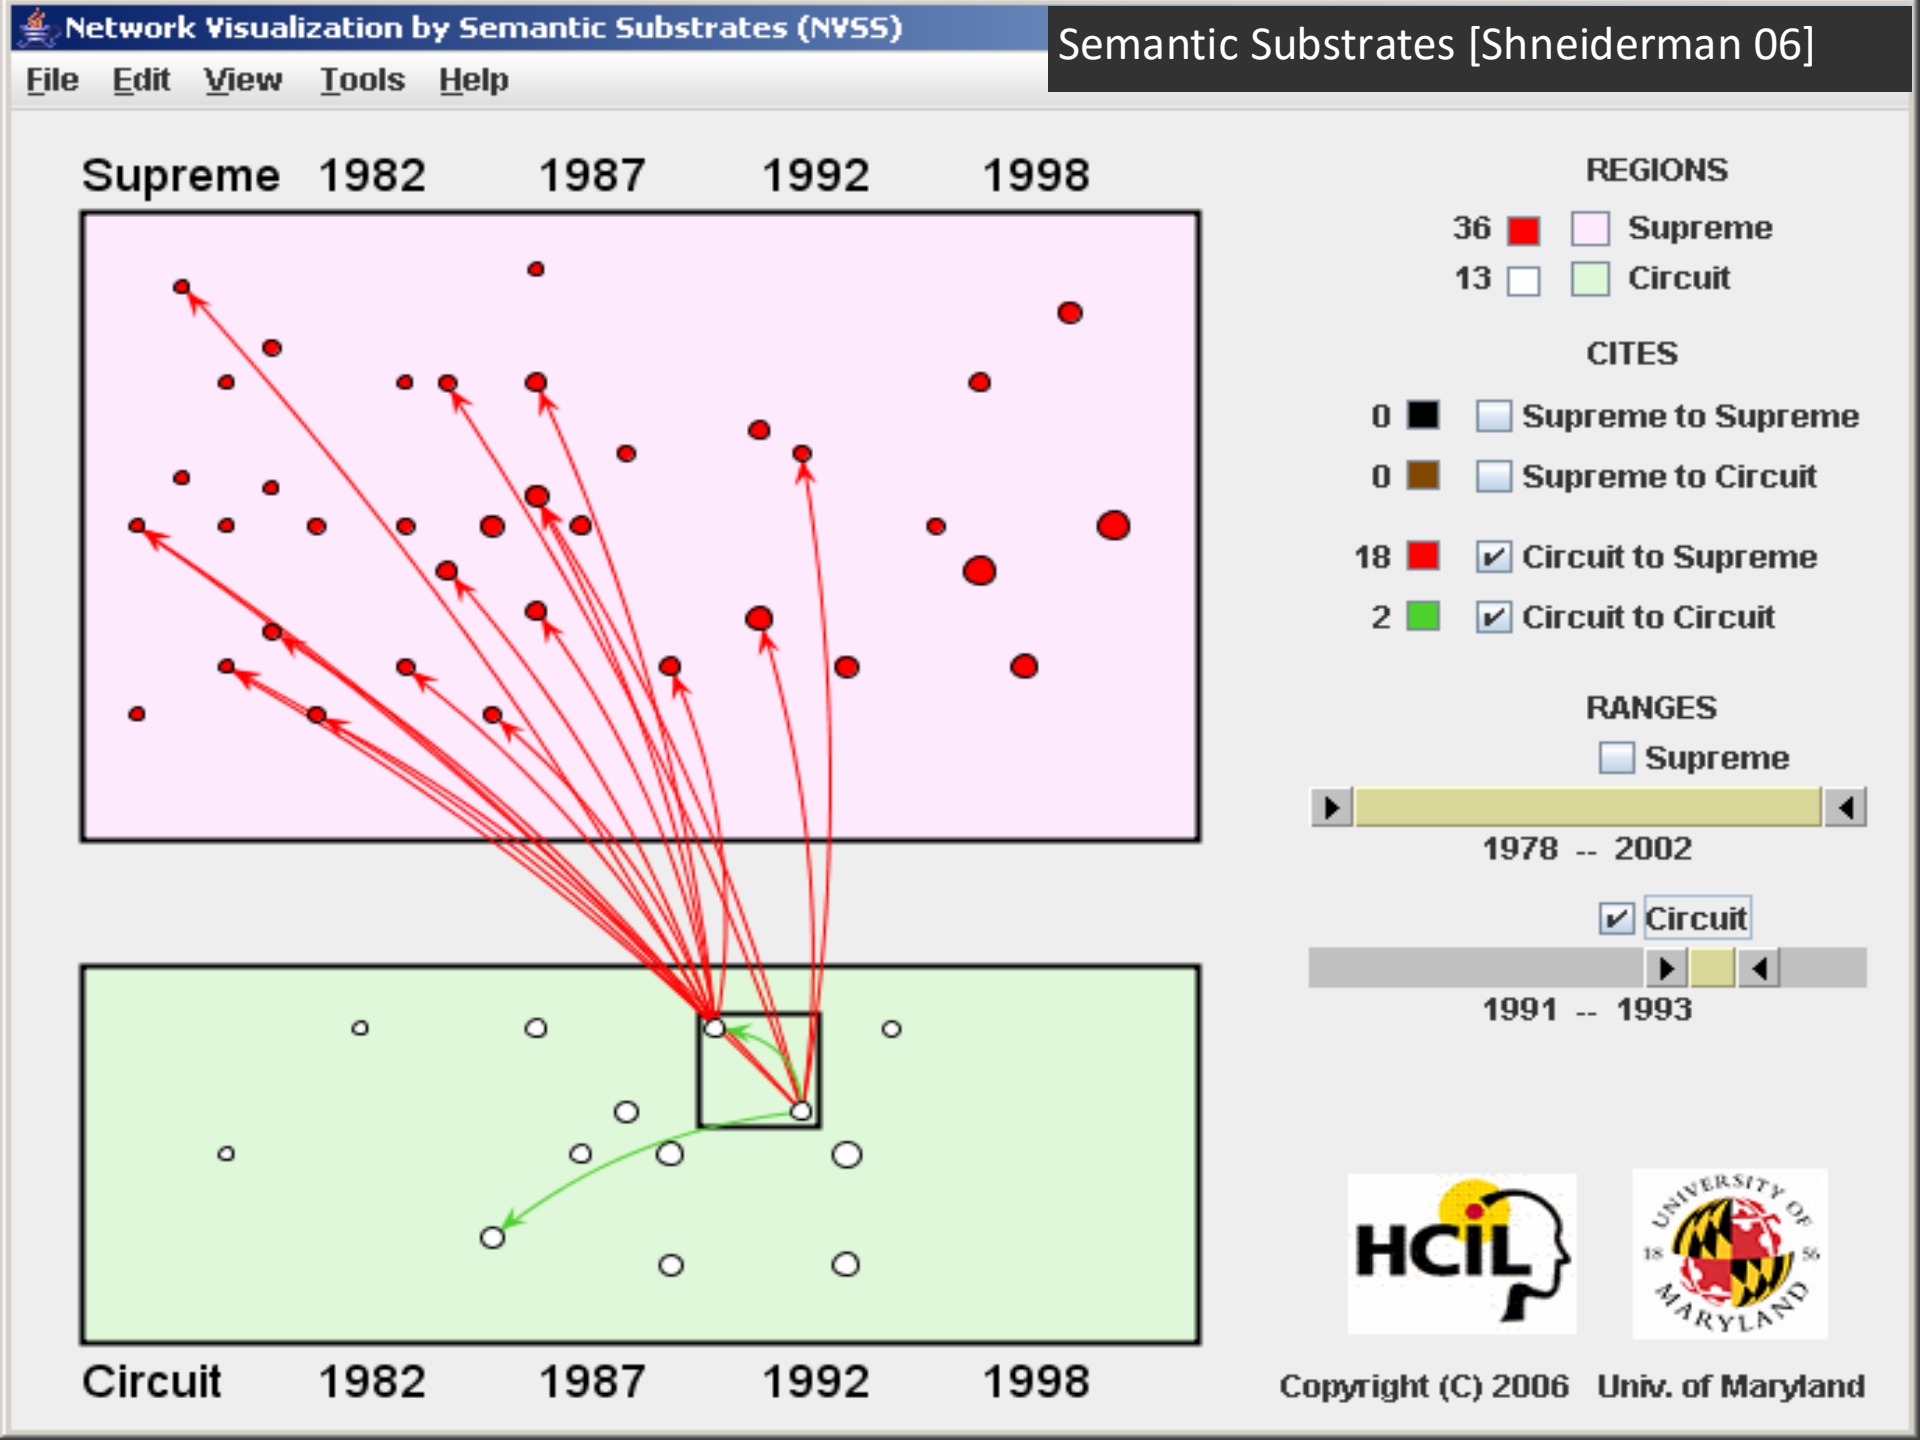


Drawing all edges is not particularly useful here…

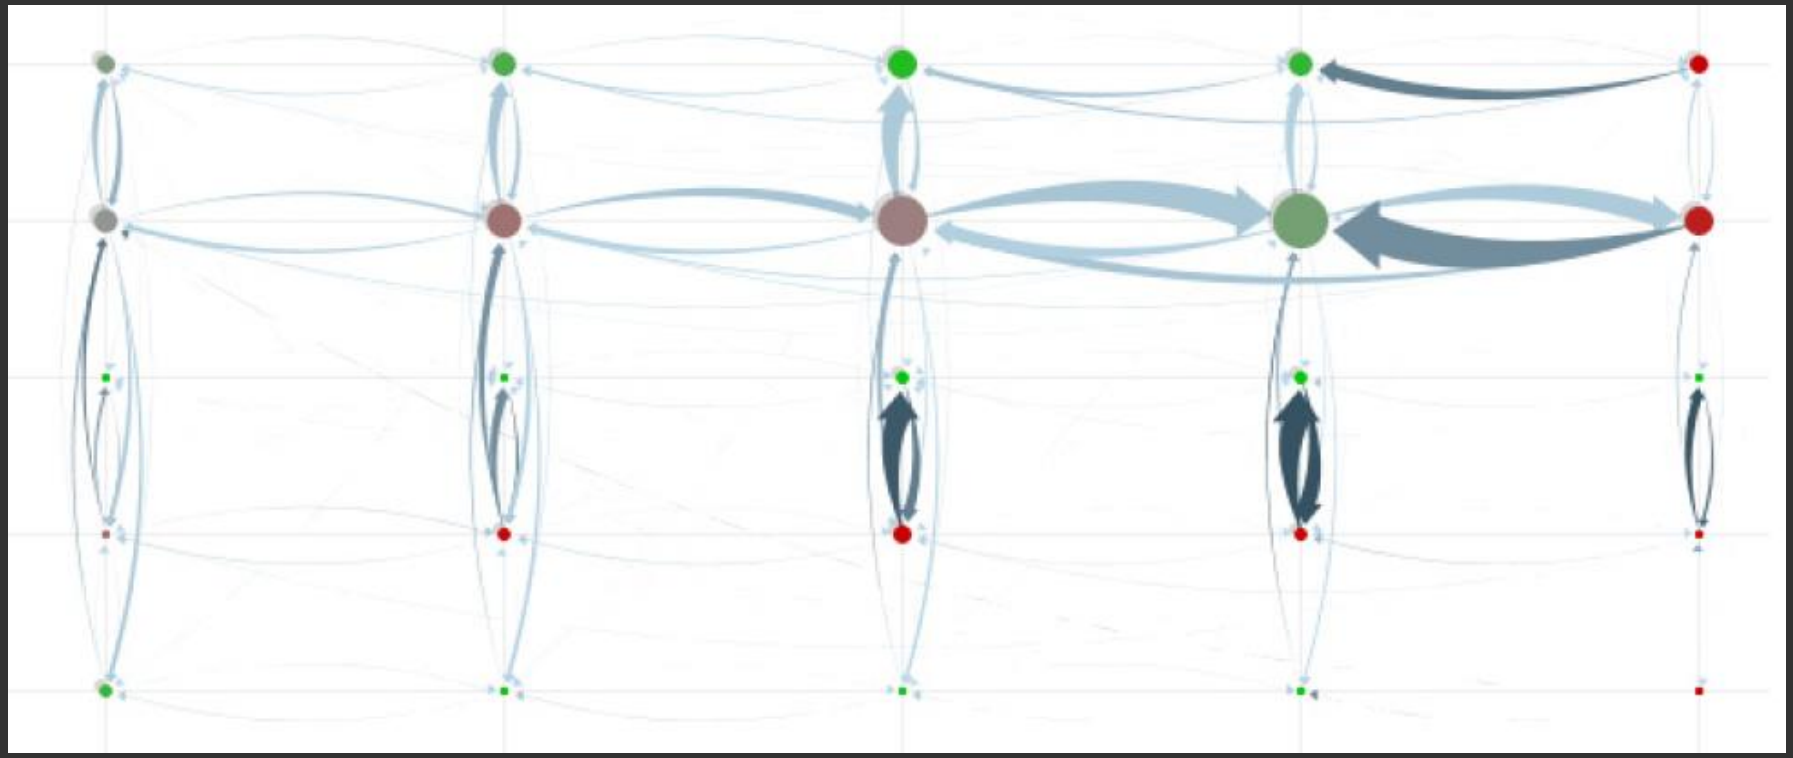


Node layout determined by geographic location.
Adjacent edges shown on node selection.

Semantic Substrates [Shneiderman 06]



PivotGraph [Wattenberg ’06]



Layout aggregate graphs using node attributes.
Analogous to pivot tables and trellis display.

PivotGraph Matrix

Limitations of PivotGraph

Only 2 variables (no nesting as in Tableau)

Doesn’t support continuous variables

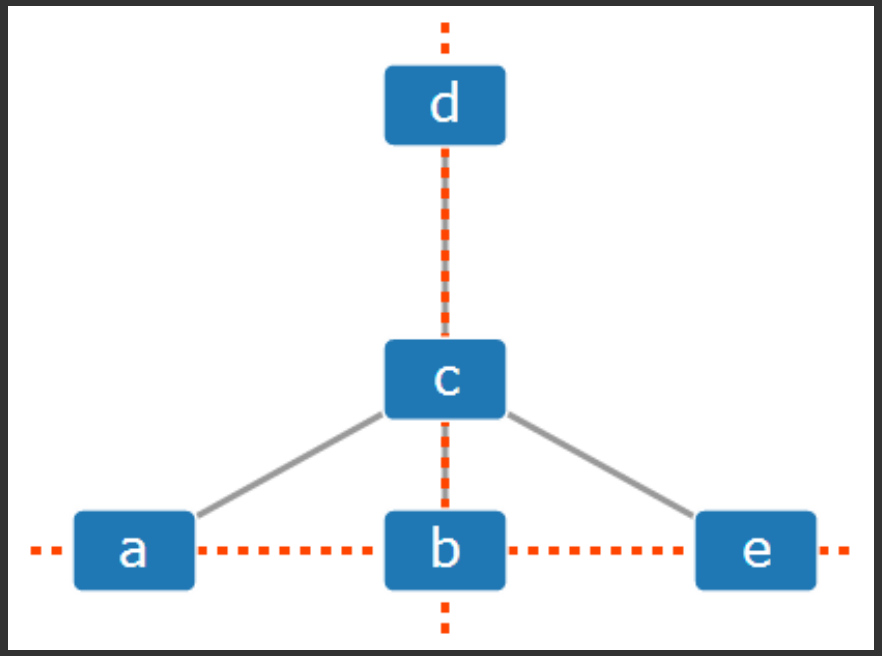
Multivariate edges?

Constraint-Based Layout

Constraint-Based Layout

Treat layout as an *optimization problem*
Define layout using an *energy model* along with *constraints*: equations the layout should obey.

Use optimization algorithms to solve



Position Constraints:
a must be to the left of b

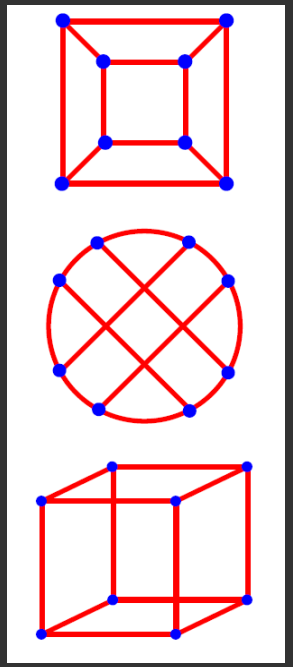
d, c, and b must have the same x position

a, b, and e must have the same y position

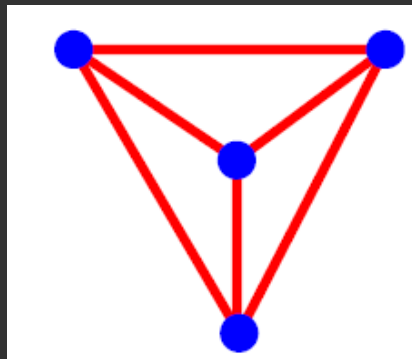
Optimizing Aesthetic Constraints

Minimize edge crossings
Minimize area
Minimize line bends
Minimize line slopes
Maximize smallest angle between edges
Maximize symmetry

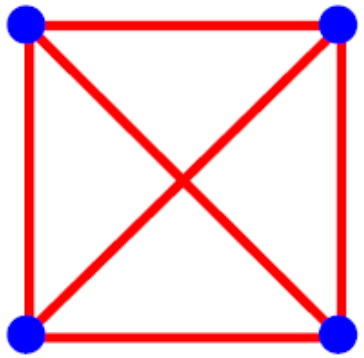
but, can't do it all.



Optimizing these criteria is often NP-Hard, requiring approximations.



min # crossings

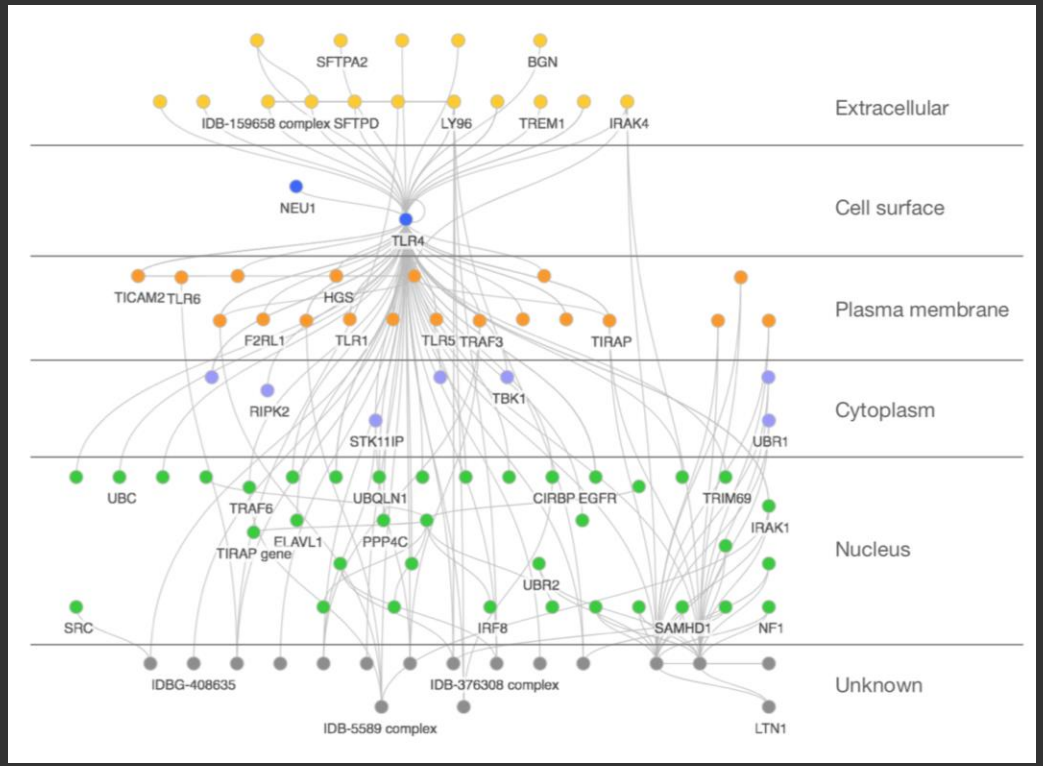


max symmetries

SetCoLa: High-Level Layout

(1) Define **sets** of nodes based on attributes.

(2) Apply **constraints** to set elements.



Layout using SetCoLa:

(1) on all nodes
  (i) position left of "rbound"
  (ii) position right of "lbound"

(2) partition type
  (iii) padding 18

(3) compose set from types
  (iv) order by type
