

**CSE 442** - Data Visualization

# Animation

Jeffrey Heer University of Washington

# Why Use Motion?

Visual variable to encode data

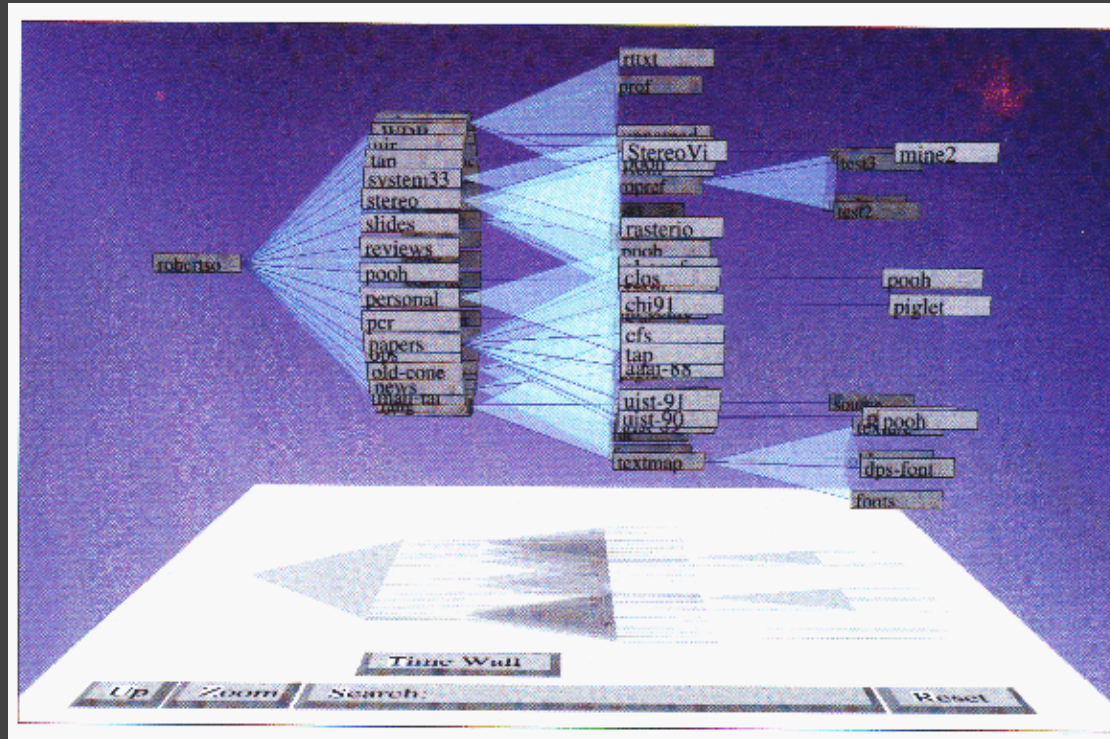

Direct attention

Understand system dynamics

Understand state transition

Increase engagement

# Cone Trees [Robertson 91]

[Video](#)

# Volume Rendering [Lacroute 95]

Video

# NameVoyager [Wattenberg 06]

# Topics

Motion perception

Animated transitions in visualizations

Implementing animations

# Motion Perception

# Perceiving Animation

Under what conditions does a sequence of static images give rise to motion perception?

Motion is perceived at about  
~10 frames/sec (100 ms).

But this does not have to be  
*smooth* motion! We can tell  
frames are discrete yet  
perceive movement.

# Motion as Visual Cue

Pre-attentive, stronger than color, shape, ...

More sensitive to motion at periphery

Similar motions perceived as a group

Motion parallax provide 3D cue (like stereopsis)

# Tracking Multiple Targets

How many dots can we simultaneously track?

# Tracking Multiple Targets

How many dots can we simultaneously track?

~4-6. Difficulty increases sig. at 6.

[Yantis 92, Pylyshn 88, Cavanagh 05]

# Grouped Dots Count as 1 Object

Dots moving together are grouped

# Grouping of Biological Motion

[Johansson 73]

# Motions Show Transitions

See change from one state to next

start

# Motions Show Transitions

See change from one state to next

end

# Motions Show Transitions

See change from one state to next

start

end

**Shows transition better, but**

Still may be too fast, or too slow

Too many objects may move at once

# Constructing Narratives [Heider 44]

# Attribution of Causality [Michotte 46]

**Michotte demonstration 1.** What do you see? Most observers report that "the red ball hit the blue ball." The blue ball moved "because the red ball hit it." Thus, the red ball is perceived to "cause" the blue ball to move, even though the balls are nothing more than color disks on your screen that move according to a programme.

<http://cogweb.ucla.edu/Discourse/Narrative/michotte-demo.swf>

# Attribution of Causality [Michotte 46]

[Reprint from Ware 04]

# Animation Helps? Hurts?

*Attention*

direct attention

distraction

*Constancy*

change tracking

false relations

*Causality*

cause and effect

false agency

*Engagement*

increase interest

"chart junk"

*Calibration*

too slow: boring

too fast: errors

# Problems with Animation [Tversky]

Difficult to estimate paths and trajectories

Motion is fleeting and transient

Cannot simultaneously attend to multiple motions

Parse motion into events, actions and behaviors

Misunderstanding and wrongly inferring causality

Anthropomorphizing physical motion may cause confusion or lead to incorrect conclusions

Animation to

communicate changes?

# Transitions between Data Graphics

During analysis and presentation it is common to transition between *related* data graphics.

**Can animation help?**

**How does this impact perception?**

# Principles for Animation

## **Congruence**

*Expressiveness?*

The structure and content of the external representation should correspond to the desired structure and content of the internal representation.

## **Apprehension**

*Effectiveness?*

The structure and content of the external representation should be readily and accurately perceived and comprehended.

[from Tversky 02]

# Principles for Animation [Heer]

## **Congruence**

- Maintain valid data graphics during transitions ←
- Use consistent syntactic/semantic mappings
- Respect semantic correspondence
- Avoid ambiguity

## **Apprehension**

- Group similar transitions
- Minimize occlusion
- Maximize predictability
- Use simple transitions
- Use staging for complex transitions
- Make transitions as long as needed, but no longer

# Principles for Animation [Heer]

## Congruence

Maintain valid data graphics during transitions

Use consistent syntactic/semantic mappings

Respect semantic correspondence

Avoid ambiguity

Visual marks should  
always represent the  
same data tuple.

## Apprehension

Group similar transitions

Minimize occlusion

Maximize predictability

Use simple transitions

Use staging for complex transitions

Make transitions as long as needed, but no longer

# Principles for Animation [Heer]

## Congruence

Maintain valid data graphics during transitions

Use consistent syntactic/semantic mappings

Respect semantic correspondence

Avoid ambiguity

→ Different operators  
should have distinct  
animations.

## Apprehension

Group similar transitions

Minimize occlusion

Maximize predictability

Use simple transitions

Use staging for complex transitions

Make transitions as long as needed, but no longer

# Principles for Animation [Heer]

## Congruence

Maintain valid data graphics during transitions

Use consistent syntactic/semantic mappings

Respect semantic correspondence

Avoid ambiguity

## Apprehension

Group similar transitions

Minimize occlusion

Maximize predictability

Use simple transitions

Use staging for complex transitions

Make transitions as long as needed, but no longer

Objects are harder to track when occluded.

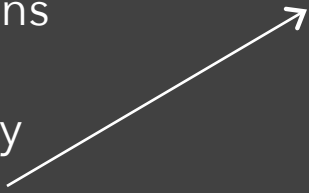

# Principles for Animation [Heer]

## Congruence

- Maintain valid data graphics during transitions
- Use consistent syntactic/semantic mappings
- Respect semantic correspondence
- Avoid ambiguity

## Apprehension

- Group similar transitions
- Minimize occlusion
- Maximize predictability
- Use simple transitions
- Use staging for complex transitions
- Make transitions as long as needed, but no longer

Keep animation as simple as possible. If complicated, break into simple stages.

# **Animated Transitions in Statistical Data Graphics**

**Jeffrey Heer  
George G. Robertson**

Microsoft  
**Research**

# Study Conclusions

**Appropriate animation improves graphical perception**

**Simple transitions beat *"do one thing at a time"***

**Simple staging was preferred and showed benefits**

*but timing important and in need of study*

**Axis re-scaling hampers perception**

Avoid if possible (use common scale)

Maintain landmarks better (delay fade out of lines)

**Subjects preferred animated transitions**

# Animation in Trend Visualization

Heer & Robertson study found that animated transitions are better than static transitions for estimating changing values.

How does animation fare vs. static time-series depictions (as opposed to static transitions)?

Experiments by Robertson et al, InfoVis 2008  
*(10 Year Test-of-Time Award at InfoVis 2018!)*

Which to prefer for analysis?  
For presentation?

# Study: Analysis & Presentation

Subjects asked comprehension questions.

Presentation condition included narration.

Multiples 10% *more accurate* than animation

*Presentation: Anim. 60% faster* than multiples

*Analysis: Animation 82% slower* than multiples

User preferences favor animation (even though less accurate and slower for analysis!)

# Administrivia

## A3: Interactive Visualization

Create an interactive visualization in a team of 1-3 people. Choose a dataset and a driving question, develop a visualization + interaction techniques, then deploy your visualization on the web.

1. Form team, topic & data and start prototyping.
2. Complete implementation and submit to Gradescope by **EOD Tuesday, February 17.**

Developer defines the redraw function

## Transition-Based Animation (Hudson & Stasko '93)

Specify property value, duration & easing

Also called **tweening** (for "in-betweens")

Typically computed via **interpolation**

$\text{step}(fraction) \{ x_{\text{now}} = x_{\text{start}} + fraction * (x_{\text{end}} - x_{\text{start}}); \}$

Timing & redraw managed by UI toolkit

# Transition-Based Animation

from: (10,10) to: (25,25) duration: 3sec

# Transition-Based Animation

**from:** (10,10) **to:** (25,25) **duration:** 3sec

*Toolkit handles frame-by-frame updates!*

# D3 Transitions

Any d3 *selection* can be used to drive animation.

# D3 Transitions

Any d3 ***selection*** can be used to drive animation.

```
// Select SVG rectangles and bind them to data values.
```

```
var bars = svg.selectAll("rect.bars").data(values);
```

# D3 Transitions

Any d3 ***selection*** can be used to drive animation.

```
// Select SVG rectangles and bind them to data values.
```

```
var bars = svg.selectAll("rect.bars").data(values);
```

```
// Static transition: update position and color of bars.
```

```
bars
```

```
  .attr("x", d => xScale(d.foo))
```

```
  .attr("y", d => yScale(d.bar))
```

```
  .style("fill", d => colorScale(d.baz));
```

# D3 Transitions

Any d3 ***selection*** can be used to drive animation.

```
// Select SVG rectangles and bind them to data values.
```

```
var bars = svg.selectAll("rect.bars").data(values);
```

```
// Animated transition: interpolate to target values using default timing
```

```
bars.transition()  
  .attr("x", d => xScale(d.foo))  
  .attr("y", d => yScale(d.bar))  
  .style("fill", d => colorScale(d.baz));
```

# D3 Transitions

var bars = svg.selectAll("rect.bars").data(values);
```

```
// Animated transition: interpolate to target values using default timing
```

```
bars.transition()  
  .attr("x", d => xScale(d.foo))  
  .attr("y", d => yScale(d.bar))  
  .style("fill", d => colorScale(d.baz));
```

```
// Animation is implicitly queued to run!
```

# D3 Transitions, Continued

```
bars.transition()  
  .duration(500)           // animation duration in milliseconds  
  .delay(0)                // onset delay in milliseconds  
  .ease(d3.easeBounce)    // set easing (or “pacing”) style  
  .attr("x", (d) => xScale(d.foo))  
  ...
```

## D3 Transitions, Continued

```
bars.transition()  
  .duration(500)           // animation duration in milliseconds  
  .delay(0)                // onset delay in milliseconds  
  .ease(d3.easeBounce)    // set easing (or "pacing") style  
  .attr("x", (d) => xScale(d.foo))  
  ...
```

```
bars.exit().transition() // animate elements leaving the display  
  .style("opacity", 0)  // fade out to fully transparent  
  .remove();           // remove from DOM upon completion
```

# Easing (or “Pacing”) Functions

**Goals:** stylize animation, improve perception.

Basic idea is to warp time: as *duration* goes from start (0%) to end (100%), dynamically adjust the *interpolation fraction* using an **easing function**.

# Easing (or "Pacing") Functions

**Goals:** stylize animation, improve perception.

  transition: color 1s ease-in-out;  
}  
  
a:hover {  
  color: red;  
}
```

**Duration** ↓

↑ **Property**      ↑ **Easing**

# CSS Transitions

## Extends CSS with Animated Transitions

```
a {  
  color: black;  
  transition: color 1s ease-in-out;  
}
```

Diagram illustrating the components of the `transition` property:

- Property**: `color` (indicated by an upward arrow from the label to the word 'color' in the code)
- Duration**: `1s` (indicated by a downward arrow from the label to the '1s' in the code)
- Easing**: `ease-in-out` (indicated by an upward arrow from the label to the 'ease-in-out' in the code)

```
a:hover {  
  color: red;  
}
```

**Animate color transition upon mouse in / out.**

Diagram illustrating the trigger for the transition:

- Animate color transition upon mouse in / out.** (indicated by a leftward arrow from the text to the word 'color' in the `a:hover` block)

# Summary

## **Animation is a salient visual phenomenon**

Attention, object constancy, causality, timing

Design with care: congruence & apprehension

For transitions, animation has demonstrated benefits,  
but **consider task and timing**
