

# Lecture 12: XQuery in SQL Server

Monday, October 23, 2006

# Announcements

- Homework 2 due on Wednesday
- Midterm on Friday. To study:
  - SQL
  - E/R diagrams
  - Functional dependencies and BCNF
- Project phase 2 due next Wednesday

# Sorting in XQuery

```
<publisher_list>
{ FOR $b IN document("bib.xml")//book[year = "97"]
  ORDER BY $b/price/text()
  RETURN <book>
    { $b/title ,
      $b/price
    }
  </book>
}
</publisher_list>
```

# If-Then-Else

```
FOR $h IN //holding
RETURN <holding>
  { $h/title,
    IF $h/@type = "Journal"
      THEN $h/editor
      ELSE $h/author
    }
  </holding>
```

# Existential Quantifiers

```
FOR $b IN //book  
WHERE SOME $p IN $b//para SATISFIES  
    contains($p, "sailing")  
    AND contains($p, "windsurfing")  
RETURN { $b/title }
```

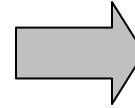

# Universal Quantifiers

```
FOR $b IN //book  
WHERE EVERY $p IN $b//para SATISFIES  
    contains($p, "sailing")  
RETURN { $b/title }
```

# Duplicate Elimination

- **distinct-values**(list-of-text-values)
- How do we eliminate duplicate “tuples” ?

```
<row> <a>3</a> <b>100</b> </row>
<row> <a>8</a> <b>500</b> </row>
<row> <a>3</a> <b>100</b> </row>
<row> <a>3</a> <b>200</b> </row>
<row> <a>8</a> <b>500</b> </row>
```

```
<row> <a>3</a> <b>100</b> </row>
<row> <a>8</a> <b>500</b> </row>
<row> <a>3</a> <b>200</b> </row>
```

# FOR v.s. LET

## FOR

- Binds *node variables* → iteration

## LET

- Binds *collection variables* → one value

# FOR v.s. LET

```
FOR $x IN /bib/book  
RETURN <result> { $x } </result>
```

Returns:

```
<result> <book>...</book></result>  
<result> <book>...</book></result>  
<result> <book>...</book></result>
```

...

```
LET $x := /bib/book  
RETURN <result> { $x } </result>
```

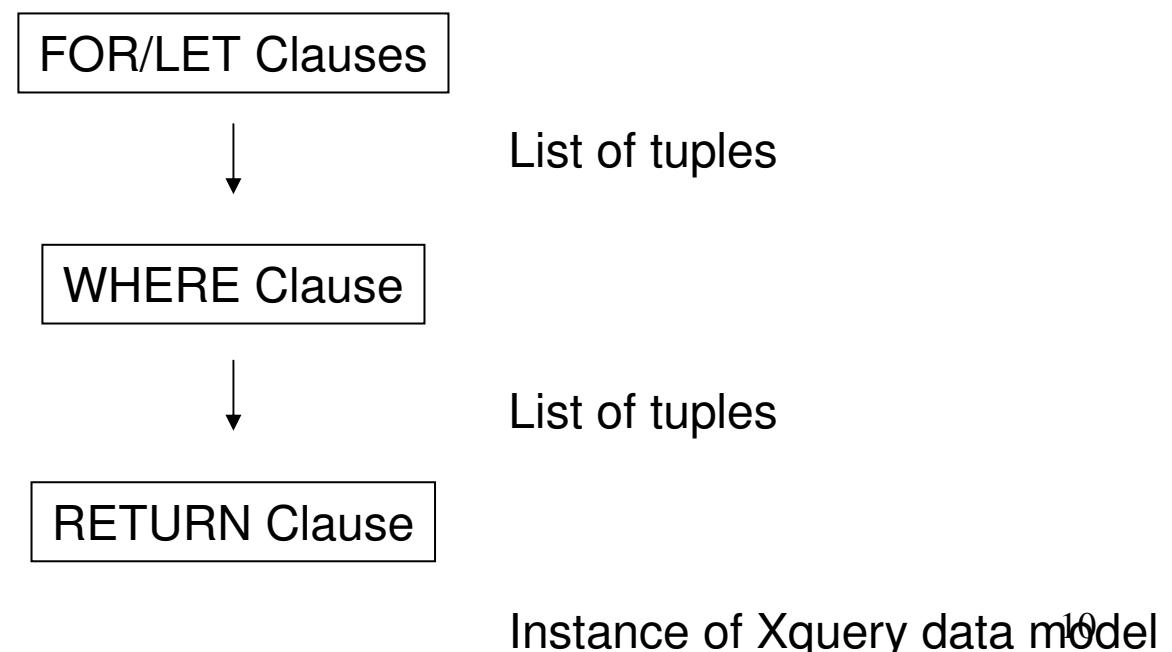

Returns:

```
<result> <book>...</book>  
      <book>...</book>  
      <book>...</book>  
      ...  
</result>
```

# XQuery

Summary:

- FOR-LET-WHERE-RETURN = FLWR

# Collections in XQuery

- Ordered and unordered collections
  - `/bib/book/author/text()` = an *ordered* collection: result is in *document order*
  - `distinct-values(/bib/book/author/text())` = an unordered collection: the output order is implementation dependent
- LET `$a := /bib/book` → `$a` is a collection
- `$b/author` → a collection (several authors...)

```
RETURN <result> { $b/author } </result>
```

Returns:

```
<result> <author>...</author>
          <author>...</author>
          <author>...</author>
          ...
</result>
```

# Collections in XQuery

What about collections in expressions ?

- $\$b/\text{price}$  → list of n prices
- $\$b/\text{price} * 0.7$  → list of n numbers
- $\$b/\text{price} * \$b/\text{quantity}$  → list of n x m numbers ??
- $\$b/\text{price} * (\$b/\text{quant1} + \$b/\text{quant2}) \neq \$b/\text{price} * \$b/\text{quant1} + \$b/\text{price} * \$b/\text{quant2}$  !!

# Other XML Topics

- Name spaces
- XML API:
  - DOM = “Document Object Model”
- XML languages:
  - XSLT
- XML Schema
- Xlink, XPointer
- SOAP

Available from [www.w3.org](http://www.w3.org)  
(but don't spend rest of your life  
reading those standards !)

# XML in SQL Server 2005

- Create tables with attributes of type XML
- Use Xquery in SQL queries
- Rest of the slides are from:

Shankar Pal et al., *Indexing XML data stored in a relational database*, VLDB'2004

```
CREATE TABLE DOCS (
    ID int primary key,
    XDOC xml)
```

```
SELECT ID, XDOC.query(
    for $s in /BOOK[@ISBN=“1-55860-438-3”]//SECTION
    return <topic>{ data($s/TITLE) } </topic>')
FROM DOCS
```

# XML Methods in SQL

- `Query()` = returns XML data type
- `Value()` = extracts scalar values
- `Exist()` = checks conditions on XML nodes
- `Nodes()` = returns a rowset of XML nodes  
that the Xquery expression evaluates to

# Examples

- From here:

<http://msdn.microsoft.com/library/default.asp?url=/library/en-us/dnsql90/html/sql2k5xml.asp>

# XML Type

```
CREATE TABLE docs (
    pk INT PRIMARY KEY,
    xCol XML not null
)
```

# Inserting an XML Value

```
INSERT INTO docs VALUES (2,  
'<doc id="123">  
  <sections>  
    <section num="1"><title>XML Schema</title></section>  
    <section num="3"><title>Benefits</title></section>  
    <section num="4"><title>Features</title></section>  
  </sections>  
</doc>')
```

# Query( )

```
SELECT pk, xCol.query('/doc[@id = 123]//section')  
FROM  docs
```

# Exists( )

```
SELECT xCol.query('/doc[@id = 123]//section')
FROM  docs
WHERE xCol.exist ('/doc[@id = 123]') = 1
```

# Value( )

```
SELECT xCol.value(  
    'data((/doc//section[@num = 3]/title)[1])', 'nvarchar(max)')  
FROM docs
```

# Nodes( )

```
SELECT nref.value('first-name[1]', 'nvarchar(50)')  
      AS FirstName,  
      nref.value('last-name[1]', 'nvarchar(50)')  
      AS LastName  
FROM  @xVar.nodes('//author') AS R(nref)  
WHERE nref.exist('.[first-name != "David"]') = 1
```

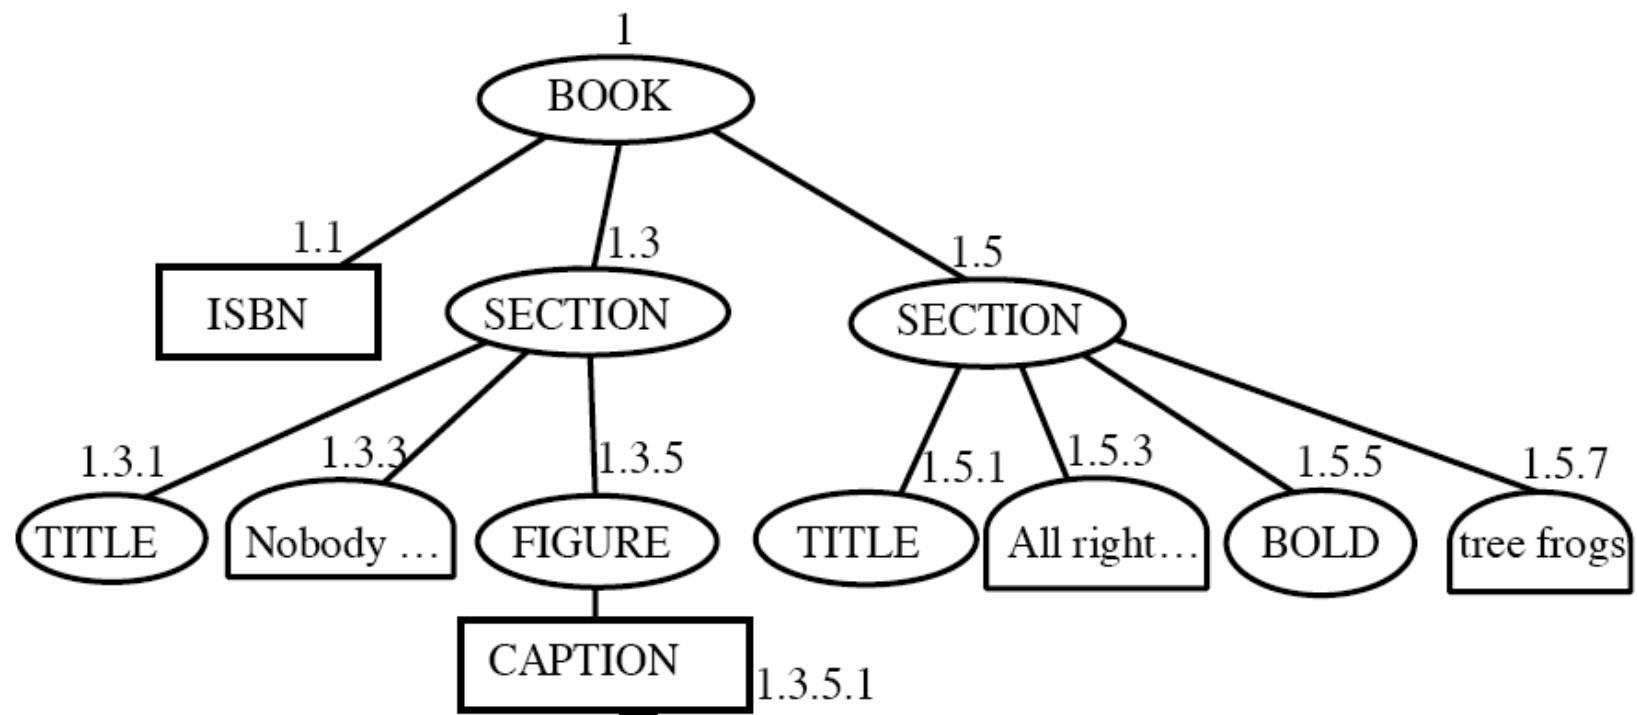

# Nodes( )

```
SELECT nref.value('@genre', 'varchar(max)') LastName  
FROM docs CROSS APPLY xCol.nodes('//book') AS R(nref)
```

# Internal Storage

- XML is “shredded” as a table
- A few important ideas:
  - Dewey decimal numbering of nodes; store in clustered B-tree index
  - Use only odd numbers to allow insertions
  - Reverse PATH-ID encoding, for efficient processing of postfix expressions like //a/b/c
  - Add more indexes, e.g. on data values
