

CSE 444: Database Internals

Lecture 10 Query Optimization (part 1)

CSE 444 - Spring 2015

1

Reminders

- Homework 2 due on Wednesday, 11:00pm
- Lab 2 due on Monday, 11:00pm

CSE 444 - Spring 2015

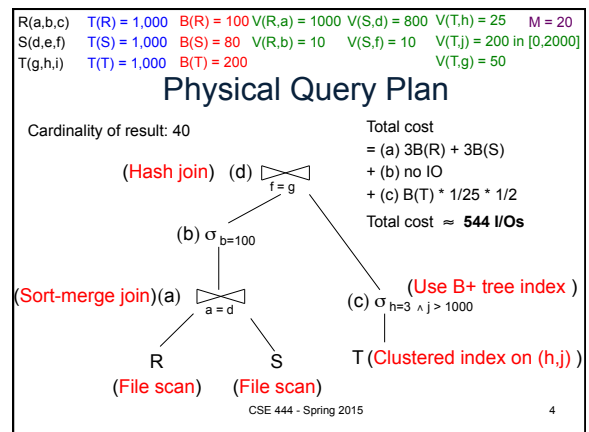

2

Review: Cost Estimation

Let's review how to do this with an example

CSE 444 - Spring 2015

3

4

Next Step: How to Find a Good Plan Automatically?

This is the role of the query optimizer

CSE 444 - Spring 2015

5

Query Optimization Overview

6

What We Already Know...

Supplier(sno, sname, scity, sstate)
Part(pno, pname, psize, pcolor)
Supply(sno, pno, price)

For each SQL query....

```
SELECT S.sname
FROM Supplier S, Supply U
WHERE S.scity='Seattle' AND S.sstate='WA'
AND S.sno = U.sno
AND U.pno = 2
```

There exist many logical query plan...

7

Example Query: Logical Plan 1

CSE 444 - Spring 2015

8

Example Query: Logical Plan 2

CSE 444 - Spring 2015

9

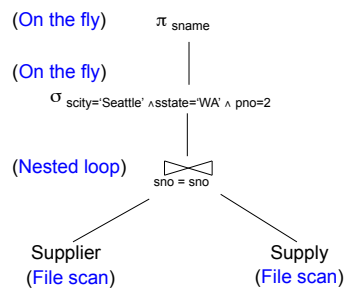

What We Also Know

- For each logical plan...
- There exist many physical plans

CSE 444 - Spring 2015

10

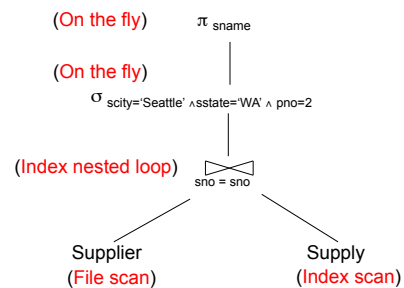

Example Query: Physical Plan 1

CSE 444 - Spring 2015

11

Example Query: Physical Plan 2

CSE 444 - Spring 2015

12

Query Optimizer Overview

- **Input:** A logical query plan
- **Output:** A good physical query plan
- **Basic query optimization algorithm**
 - Enumerate alternative plans (logical and physical)
 - Compute estimated cost of each plan
 - Compute number of I/Os
 - Optionally take into account other resources
 - Choose plan with lowest cost
 - This is called cost-based optimization

CSE 444 - Spring 2015

13

Lessons

- No magic “best” plan: depends on the data
- In order to make the right choice
 - Need to have **statistics** over the data
 - The B's, the T's, the V's
 - Commonly (and in lab 4): histograms over base data

CSE 444 - Spring 2015

14

Outline

- Search space
- Algorithm for enumerating query plans

CSE 444 - Spring 2015

15

Relational Algebra Equivalences

- **Selections**
 - Commutative: $\sigma_{c1}(\sigma_{c2}(R))$ same as $\sigma_{c2}(\sigma_{c1}(R))$
 - Cascading: $\sigma_{c1 \wedge c2}(R)$ same as $\sigma_{c2}(\sigma_{c1}(R))$
- **Projections**
 - Cascading
- **Joins**
 - Commutative : $R \bowtie S$ same as $S \bowtie R$
 - Associative: $R \bowtie (S \bowtie T)$ same as $(R \bowtie S) \bowtie T$

CSE 444 - Spring 2015

16

Left-Deep Plans, Bushy Plans, and Linear Plans

Linear plan: One input to each join is a relation from disk
Can be either left or right input

CSE 444 - Spring 2015

17

Commutativity, Associativity, Distributivity

$$R \cup S = S \cup R, R \cup (S \cap T) = (R \cup S) \cap T$$

$$R \bowtie S = S \bowtie R, R \bowtie (S \bowtie T) = (R \bowtie S) \bowtie T$$

$$R \bowtie (S \cup T) = (R \bowtie S) \cup (R \bowtie T)$$

CSE 444 - Spring 2015

18

Laws Involving Selection

$$\begin{aligned}\sigma_{C \text{ AND } C'}(R) &= \sigma_C(\sigma_{C'}(R)) = \sigma_C(R) \cap \sigma_{C'}(R) \\ \sigma_{C \text{ OR } C'}(R) &= \sigma_C(R) \cup \sigma_{C'}(R) \\ \sigma_C(R \bowtie S) &= \sigma_C(R) \bowtie S\end{aligned}$$

$$\begin{aligned}\sigma_C(R - S) &= \sigma_C(R) - S \\ \sigma_C(R \cup S) &= \sigma_C(R) \cup \sigma_C(S) \\ \sigma_C(R \bowtie S) &= \sigma_C(R) \bowtie S\end{aligned}$$

Assuming C on attributes of R

CSE 444 - Spring 2015

19

Example: Simple Algebraic Laws

- Example: $R(A, B, C, D), S(E, F, G)$

$$\sigma_{F=3}(R \bowtie_{D=E} S) = ?$$

$$\sigma_{A=5 \text{ AND } G=9}(R \bowtie_{D=E} S) = ?$$

CSE 444 - Spring 2015

20

Example: Simple Algebraic Laws

- Example: $R(A, B, C, D), S(E, F, G)$

$$\sigma_{F=3}(R \bowtie_{D=E} S) = R \bowtie_{D=E} \sigma_{F=3}(S)$$

$$\sigma_{A=5 \text{ AND } G=9}(R \bowtie_{D=E} S) = \sigma_{A=5}(R) \bowtie_{D=E} \sigma_{G=9}(S)$$

CSE 444 - Spring 2015

21

Laws Involving Projections

$$\Pi_M(R \bowtie S) = \Pi_M(\Pi_P(R) \bowtie \Pi_Q(S))$$

$$\Pi_M(\Pi_N(R)) = \Pi_M(R)$$

/* note that $M \subseteq N$ */

- Example $R(A,B,C,D), S(E, F, G)$

$$\Pi_{A,B,G}(R \bowtie_{D=E} S) = \Pi_{\gamma}(\Pi_{\gamma}(R) \bowtie_{D=E} \Pi_{\gamma}(S))$$

CSE 444 - Spring 2015

22

Laws Involving Projections

$$\Pi_M(R \bowtie S) = \Pi_M(\Pi_P(R) \bowtie \Pi_Q(S))$$

$$\Pi_M(\Pi_N(R)) = \Pi_M(R)$$

/* note that $M \subseteq N$ */

- Example $R(A,B,C,D), S(E, F, G)$

$$\Pi_{A,B,G}(R \bowtie_{D=E} S) = \Pi_{A,B,G}(\Pi_{A,B,D}(R) \bowtie_{D=E} \Pi_{E,G}(S))$$

CSE 444 - Spring 2015

23

Laws involving grouping and aggregation

$$\begin{aligned}\gamma_{A, \text{agg}(D)}(R(A,B) \bowtie_{B=C} S(C,D)) &= \\ \gamma_{A, \text{agg}(D)}(R(A,B) \bowtie_{B=C} (\gamma_{C, \text{agg}(D)} S(C,D))) &\end{aligned}$$

CSE 444 - Spring 2015

24

Laws involving grouping and aggregation

$$\delta(\gamma_{A, \text{agg}(B)}(R)) = \gamma_{A, \text{agg}(B)}(R)$$

$$\gamma_{A, \text{agg}(B)}(\delta(R)) = \gamma_{A, \text{agg}(B)}(R)$$

if *agg* is “duplicate insensitive”

Which of the following are “duplicate insensitive” ?
sum, count, avg, min, max

CSE 444 - Spring 2015

25

Laws Involving Constraints

Product(pid, pname, price, cid)
Company(cid, cname, city, state)

Foreign key

$$\Pi_{\text{pid, price}}(\text{Product} \bowtie_{\text{cid=cid}} \text{Company}) = \Pi_{\text{pid, price}}(\text{Product})$$

CSE 444 - Spring 2015

26

Search Space Challenges

- Search space is huge!
 - Many possible equivalent trees
 - Many implementations for each operator
 - Many access paths for each relation
 - File scan or index + matching selection condition
- Cannot consider ALL plans
 - Heuristics: only partial plans with “low” cost

CSE 444 - Spring 2015

27

Outline

- Search space
- Algorithm for enumerating query plans

CSE 444 - Spring 2015

28

Key Decisions

Logical plan

- What logical plans do we consider (left-deep, bushy?); *Search Space*
- Which algebraic laws do we apply, and in which context(s)?; *Optimization rules*
- In what order do we explore the search space?; *Optimization algorithm*

CSE 444 - Spring 2015

29

Key Decisions

Physical plan

- What physical operators to use?
- What access paths to use (file scan or index)?
- Pipeline or materialize intermediate results?

These decisions also affect the *search space*

CSE 444 - Spring 2015

30

Two Types of Optimizers

- **Heuristic-based optimizers:**
 - Apply greedily rules that always improve plan
 - Typically: push selections down
 - Very limited: no longer used today
- **Cost-based optimizers:**
 - Use a cost model to estimate the cost of each plan
 - Select the “cheapest” plan
 - We focus on cost-based optimizers

CSE 444 - Spring 2015

31

Three Approaches to Search Space Enumeration

- Complete plans
- Bottom-up plans
- Top-down plans

CSE 444 - Spring 2015

32

Complete Plans

R(A,B)
S(B,C)
T(C,D)

```
SELECT *
FROM R, S, T
WHERE R.B=S.B and S.C=T.C and R.A<40
```

Answer: No way to do early pruning

33

Bottom-up Partial Plans

R(A,B)
S(B,C)
T(C,D)

```
SELECT *
FROM R, S, T
WHERE R.B=S.B and S.C=T.C and R.A<40
```

Why is this better?

34

Top-down Partial Plans

R(A,B)
S(B,C)
T(C,D)

```
SELECT *
FROM R, S, T
WHERE R.B=S.B and S.C=T.C and R.A<40
```

CSE 444 - Spring 2015

35

Two Types of Plan Enumeration Algorithms

- **Dynamic programming (in class)**
 - Based on System R (aka Selinger) style optimizer[1979]
 - Limited to joins: *join reordering algorithm*
 - **Bottom-up**
- **Rule-based algorithm (will not discuss)**
 - Database of rules (=algebraic laws)
 - Usually: dynamic programming
 - Usually: **top-down**

CSE 444 - Spring 2015
