

# Final Project Instructions

See course website for details!

- 1. Design and implementation:
- There is a mandatory part and extensions
  Design, implement, and evaluate one extension
- Design, implement, and evaluate one exten
- 2. Testing and evaluation
  - For your extension, write your own JUnit tests
  - Feel free to also write scripts
- 3. Final report

CSE 444 - Winter 2017

3

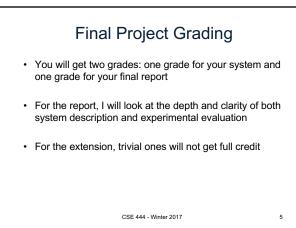

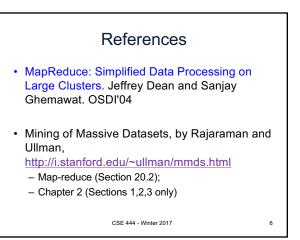

- Single-column & single-spaced
- Write your name!
- Structure of the final report
  - Sec 1. Overall System Architecture (2 pages)
     Can reuse text from lab write-ups
  - Sec 2. Detailed design of the query optimizer and your extension (3 pages)
    - Include an **analysis** of the query plans that your system generates in different scenarios.

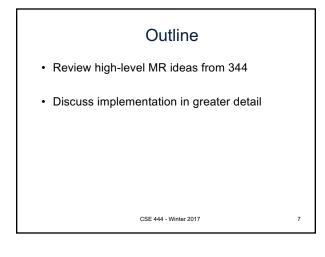

4

- Sec 3. Discussion (0.5-1 page)

CSE 444 - Winter 2017

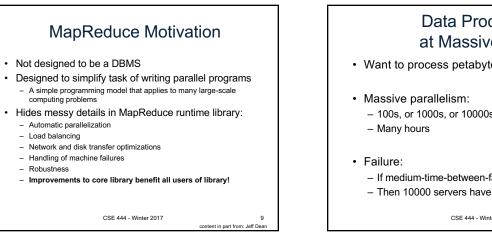

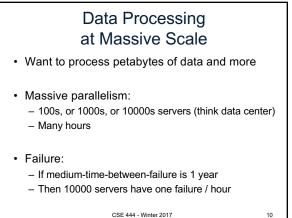

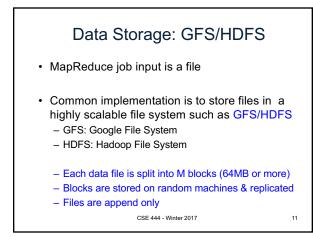

### Map Reduce Review

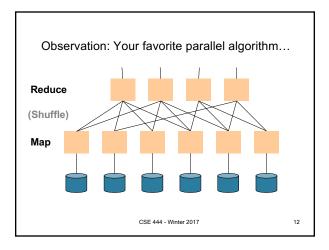

- · Google: [Dean 2004]
- · Open source implementation: Hadoop
- MapReduce = high-level programming model and implementation for large-scale parallel data processing

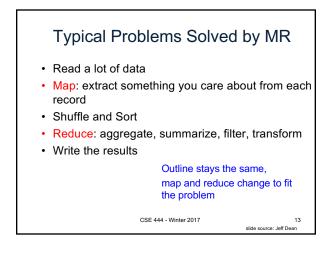

CSE 444 - Winter 2017

### Data Model

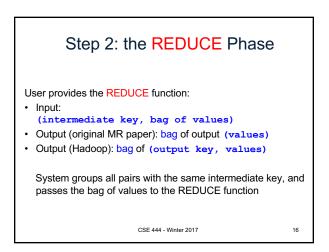

Files !

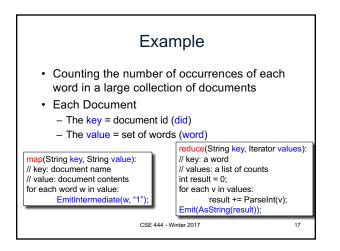

- A file = a bag of (key, value) pairs
- A MapReduce program:
- Input: a bag of (inputkey, value) pairs
- Output: a bag of (outputkey, value) pairs

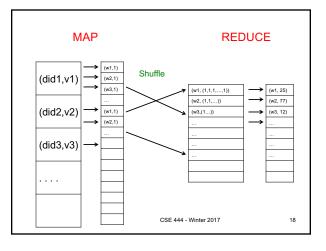

CSE 444 - Winter 2017

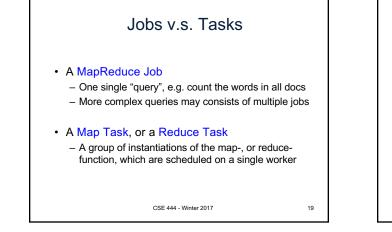

14

Step 1: the MAP Phase
User provides the MAP-function:
. input: (input key, value)
. Ouput: bag of (intermediate key, value)
System applies map function in parallel to all
(input key, value) pairs in the input file

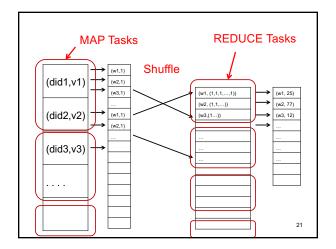

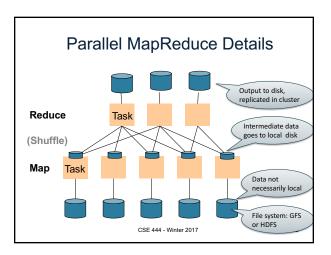

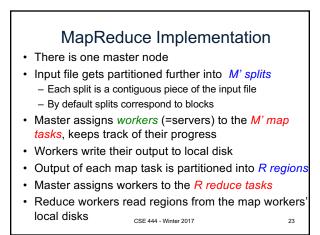

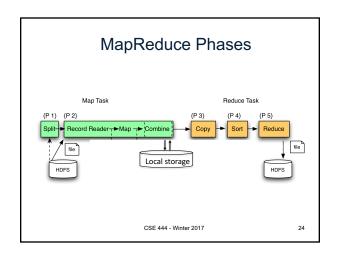

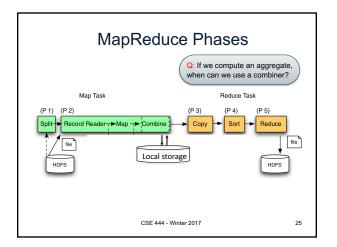

# Workers A worker is a process that executes one task at a time Typically there is one worker per processor, hence 4 or 8 per node Often talk about "slots" E.g., Each server has 2 map slots and 2 reduce slots

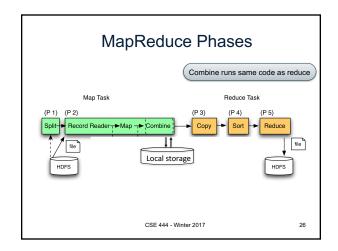

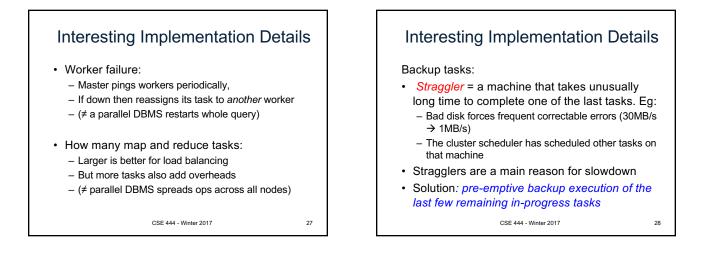

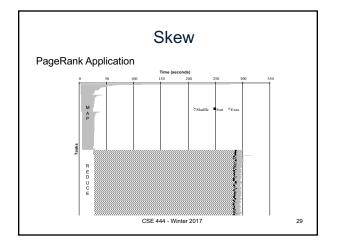

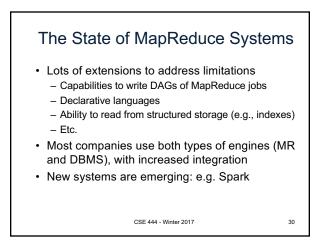

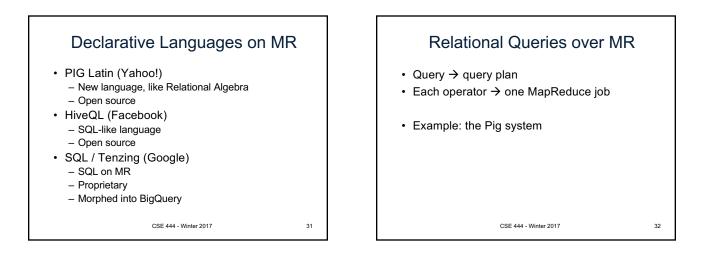

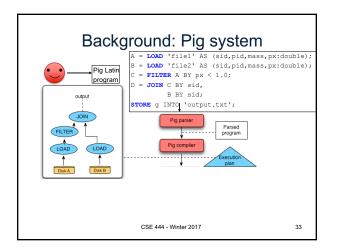

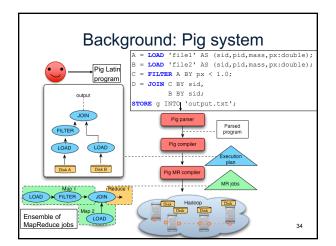

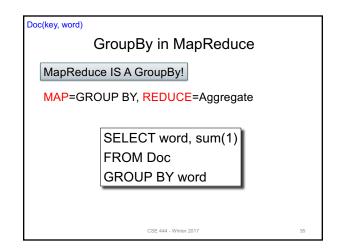

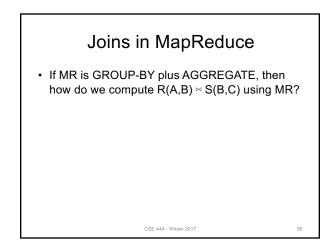

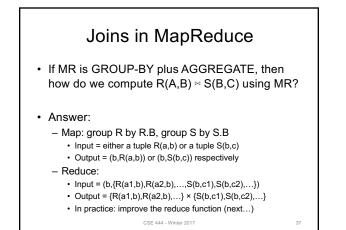

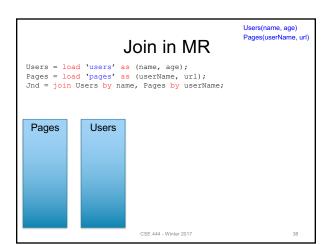

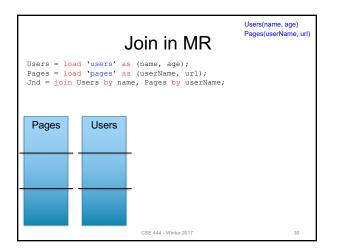

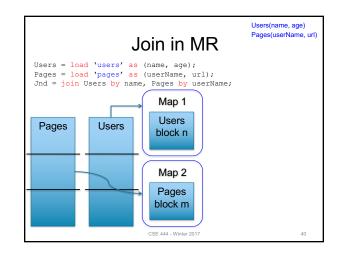

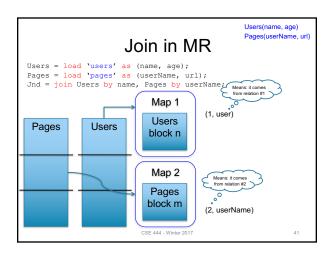

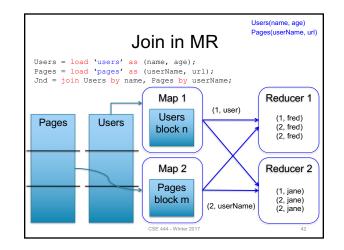

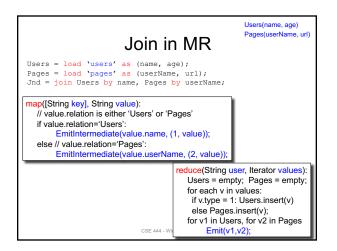

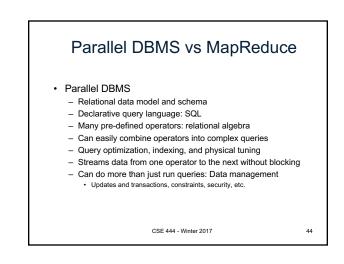

## Parallel DBMS vs MapReduce

- MapReduce
  - Data model is a file with key-value pairs!
  - No need to "load data" before processing it
  - Easy to write user-defined operators
  - Can easily add nodes to the cluster (no need to even restart) - Uses less memory since processes one key-group at a time
  - Intra-query fault-tolerance thanks to results on disk

  - Intermediate results on disk also facilitate scheduling - Handles adverse conditions: e.g., stragglers

  - Arguably more scalable... but also needs more nodes!
