

# CSE 444: Database Internals

## Lecture 25 Replication

## References

- Ullman Book Chapter 20.6
- **Database management systems.**  
Ramakrishnan and Gehrke.  
Third Ed. **Chapter 22.11**

## Outline

- Goals of replication
- Three types of replication
  - Eager replication
  - Lazy replication
  - Two-tier replication

## Goals of Replication

- Goal 1: availability
- Goal 2: performance

- **But, it's easy to build a replicated system that reduces performance and availability**

## Synchronous Replication

- Also called **eager replication**
- All updates are applied to all replicas (or to a majority) as part of a single transaction (need two phase commit)
- Main goal: as if there was only one copy
  - Maintain **consistency**
  - Maintain **one-copy serializability**
  - I.e., execution of transactions has same effect as an execution on a non-replicated db
- Transactions must acquire **global locks**

## Synchronous Master Replication

- **One master for each object holds primary copy**
  - The "Master" is also called "Primary"
  - To update object, transaction must acquire a lock at the master
  - Lock at the master is global lock
- Master propagates updates to replicas synchronously
  - Updates propagate as part of the same distributed transaction
    - Need to run 2PC at the end
  - For example, using triggers

## Crash Failures

- What happens when a secondary crashes?
  - Nothing happens
  - When secondary recovers, it catches up
- What happens when the master/primary fails?
  - Blocking would hurt availability
  - Must choose a new primary: run election

## Network Failures

- Network failures can cause trouble...
  - Secondaries think that primary failed
  - Secondaries elect a new primary
  - But primary can still be running
  - Now have two primaries!

## Majority Consensus

- To avoid problem, only majority partition can continue processing at any time
- In general,
  - Whenever a replica fails or recovers...
  - a set of communicating replicas must determine...
  - whether they have a majority before they can continue

## Synchronous Group Replication

- With  $n$  copies
  - Exclusive lock on  $x$  copies is global exclusive lock
  - Shared lock on  $s$  copies is global shared lock
  - Must have:  $2x > n$  and  $s + x > n$
- Majority locking
  - $s = x = \lceil (n+1)/2 \rceil$
  - No need to run any reconfiguration algorithms
- Read-locks-one, write-locks-all
  - $s=1$  and  $x = n$ , high read performance
  - Need to make sure algo runs on quorum of computers

## Synchronous Replication Properties

- Favours consistency over availability
  - Only majority partition can process requests
  - There appears to be a single copy of the db
- High runtime overhead
  - Must lock and update at least majority of replicas
  - Two-phase commit
  - Runs at pace of slowest replica in quorum
  - So overall system is now slower
  - Higher deadlock rate (transactions take longer)

## Asynchronous Replication

- Also called lazy replication
- Also called optimistic replication
- Main goals: availability and performance
- Approach
  - One replica updated by original transaction
  - Updates propagate asynchronously to other replicas

## Asynchronous Master Replication

- **One master holds primary copy**
  - Transactions update primary copy
  - Master asynchronously propagates updates to replicas, which process them in same order (e.g. through log shipping)
  - Ensures single-copy serializability
- **What happens when master/primary fails?**
  - Can lose most recent transactions when primary fails!
  - After electing a new primary, secondaries must agree who is most up-to-date

## Asynchronous Group Replication

- Also called **multi-master**
- Best scheme for availability
- **Cannot guarantee one-copy serializability!**

CSE 444 - Winter 2017

14

## Asynchronous Group Replication

- **Cannot guarantee one-copy serializability!**
- **Instead guarantee convergence**
  - Db state does not reflect any serial execution
  - But all replicas have the same state
- **Detect conflicts and reconcile replica states**
- Different reconciliation techniques are possible
  - Manual
  - Most recent timestamp wins
  - Site A wins over site B
  - User-defined rules, etc.

17

## Asynchronous Group Replication Properties

- Favours **availability** over consistency
  - Can read and update any replica
  - High runtime performance
- **Weak consistency**
  - Conflicts and reconciliation

CSE 444 - Winter 2017

18

## Two-Tier Replication

- Benefits of lazy master and lazy group
- Each object has a master with primary copy
- When disconnected from master
  - Secondary can only run tentative transactions
- When reconnects to master
  - Master reprocesses all tentative transactions
  - Checks an acceptance criterion
  - If passes, we now have final commit order
  - Secondary undoes tentative and redoes committed

## Conclusion

- Replication is a very important problem
  - Fault-tolerance (various forms of replication)
  - Caching (lazy master)
  - Warehousing (lazy master)
  - Mobility (two-tier techniques)
- Replication is complex, but basic techniques and trade-offs are very well known
  - Synchronous or asynchronous replication
  - Master or quorum
