

CSE 444: Database Internals

Lectures 5-6 Indexing

CSE 444 - Winter 2018

1

Announcements

- HW1 due tonight by 11pm
 - Turn in an electronic copy (word/pdf) by 11pm, or
 - Turn in a hard copy after class or during office hour.
- Lab1 is due on Wednesday, 11pm
 - Do not fall behind on labs! Labs build on each other
- 544M first reading due tonight... but flexible
- HW2 has been released
- Monday is a holiday

CSE 444 - Winter 2018

2

Basic Access Method: Heap File

API

- **Create** or **destroy** a file
- **Insert** a record
- **Delete** a record with a given rid (rid)
 - rid: unique tuple identifier (more later)
- **Get** a record with a given rid
 - Not necessary for sequential scan operator
 - But used with indexes
- **Scan** all records in the file

CSE 444 - Winter 2018

3

But Often Also Want....

- **Scan** all records in the file that match a **predicate** of the form **attribute op value**
 - Example: Find all students with GPA > 3.5
- Critical to support such requests efficiently
 - Why read all data from disk when we only need a small fraction of that data?
- This lecture and next, we will learn how

CSE 444 - Winter 2018

4

Searching in a Heap File

File is **not sorted** on any attribute

Student(sid: int, age: int, ...)

30	18	...	} 1 record
70	21		
20	20		} 1 page
40	19		
80	19		
60	18		
10	21		
50	22		

CSE 444 - Winter 2018

5

Heap File Search Example

- 10,000 students
- 10 student records per page
- **Total number of pages: 1,000 pages**
- Find student whose sid is 80
 - **Must read on average 500 pages**
- Find all students older than 20
 - **Must read all 1,000 pages**
- **Can we do better?**

CSE 444 - Winter 2018

6

Sequential File

File **sorted on an attribute**, usually on primary key

Student(sid: int, age: int, ...)

10	21	...
20	20	
30	18	
40	19	
50	22	
60	18	
70	21	
80	19	

CSE 444 - Winter 2018

7

Sequential File Example

- Total number of pages: 1,000 pages
- Find student whose sid is 80
 - Could do binary search, read $\log_2(1,000) \approx 10$ pages
- Find all students older than 20
 - Must still read all 1,000 pages
- Can we do even better?
- Note: Sorted files are inefficient for inserts/deletes

CSE 444 - Winter 2018

8

Outline

- Index structures
 - Hash-based indexes
 - B+ trees
- } Today
 } Next time

CSE 444 - Winter 2018

9

Indexes

- **Index**: data structure that organizes data records on disk to optimize selections on the **search key fields** for the index
- An index contains a collection of **data entries**, and supports **efficient retrieval of all data entries with a given search key value k**
- Indexes are also access methods!
 - So they provide the same API as we have seen for Heap Files
 - And efficiently support scans over tuples matching predicate on search key

CSE 444 - Winter 2018

10

Indexes

- **Search key** = can be any set of fields
 - not the same as the primary key, nor a key
- **Index** = collection of data entries
- **Data entry** for key k can be:
 - (k, RID)
 - (k, list-of-RIDs)
 - The actual record with key k
 - In this case, **the index is also a special file organization**
 - Called: "indexed file organization"

CSE 444 - Winter 2018

11

Different Types of Files

- For the data inside base relations:
 - **Heap file** (tuples stored without any order)
 - **Sequential file** (tuples sorted on some attribute(s))
 - **Indexed file** (tuples organized following an index)
- Then we can have additional **index files** that store (key,rid) pairs
- Index can also be a "**covering index**"
 - Index contains (search key + other attributes, rid)
 - Index suffices to answer some queries

CSE 444 - Winter 2018

12

Primary Index

- **Primary index** determines location of indexed records
- **Dense index**: sequence of (key,rid) pairs

CSE 444 - Winter 2018

13

Primary Index

- **Sparse index**

CSE 444 - Winter 2018

14

Primary Index with Duplicate Keys

- Sparse index: pointer to lowest search key on each page: Example search for 20

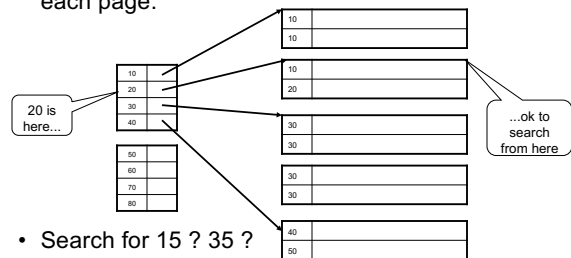

CSE 444 - Winter 2018

15

Primary Index with Duplicate Keys

- Better: pointer to **lowest new search key** on each page:

- Search for 15 ? 35 ?

CSE 444 - Winter 2018

16

Primary Index with Duplicate Keys

- Dense index:

CSE 444 - Winter 2018

17

Primary Index: Back to Example

- Let's assume all pages of index fit in memory
- Find student whose sid is 80
 - Index (dense or sparse) points directly to the page
 - Only need to read 1 page from disk.
- Find all students older than 20
 - Must still read all 1,000 pages.
- How can we make both queries fast?

CSE 444 - Winter 2018

18

Secondary Indexes

- Do not determine placement of records in data files
- Always dense (why ?)

CSE 444 - Winter 2018

19

Clustered vs. Unclustered Index

CLUSTERED

UNCLUSTERED

Clustered = records close in index are close in data

CSE 444 - Winter 2018

20

Clustered/Unclustered

- Primary index = clustered by definition
- Secondary indexes = usually unclustered

CSE 444 - Winter 2018

21

Secondary Indexes

- Applications
 - Index unsorted files (heap files)
 - When necessary to have multiple indexes
 - Index files that hold data from two relations
 - Called "clustered file"
 - Notice the different use of the term "clustered"!

CSE 444 - Winter 2018

22

Index Classification Summary

- **Primary/secondary**
 - Primary = determines the location of indexed records
 - Secondary = cannot reorder data, does not determine data location
- **Dense/sparse**
 - Dense = every key in the data appears in the index
 - Sparse = the index contains only some keys
- **Clustered/unclustered**
 - Clustered = records close in index are close in data
 - Unclustered = records close in index may be far in data
- B+ tree / Hash table / ...

CSE 444 - Winter 2018

23

Large Indexes

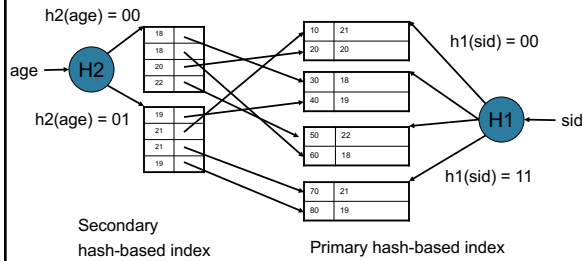

- What if index does not fit in memory?
- Would like to index the index itself
 - Hash-based index
 - Tree-based index

CSE 444 - Winter 2018

24

Hash-Based Index

Good for point queries but not range queries

CSE 444 - Winter 2018

25

Tree-Based Index

- How many index levels do we need?
- Can we create them automatically? **Yes!**
- Can do something even more powerful!

CSE 444 - Winter 2018

26

B+ Trees

- Search trees
- Idea in B Trees
 - Make 1 node = 1 page (= 1 block)
 - Keep tree balanced in height
- Idea in B+ Trees
 - Make leaves into a linked list : facilitates range queries

CSE 444 - Winter 2018

27

B+ Trees

Note: can also store data records directly as data entries

CSE 444 - Winter 2018

28

B+ Trees Basics

- Parameter d = the **degree**
- Each node has $d \leq m \leq 2d$ keys (except root)

- Each leaf has $d \leq m \leq 2d$ keys:

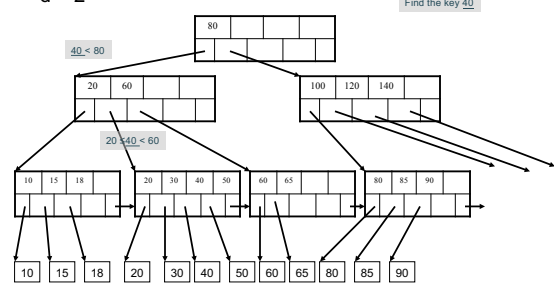

CSE 444 - Winter 2018

29

B+ Tree Example

$d = 2$

CSE 444 - Winter 2018

30

Searching a B+ Tree

- Exact key values:
 - Start at the root
 - Proceed down, to the leaf

```
Select name
From Student
Where age = 25
```

- Range queries:
 - Find lowest bound as above
 - Then sequential traversal

```
Select name
From Student
Where 20 <= age
and age <= 30
```

CSE 444 - Winter 2018

31

B+ Tree Design

- How large d ?
- Example:
 - Key size = 4 bytes
 - Pointer size = 8 bytes
 - Block size = 4096 bytes
- $2d \times 4 + (2d+1) \times 8 \leq 4096$
- $d = 170$

CSE 444 - Winter 2018

32

B+ Trees in Practice

- Typical order: 100. Typical fill-factor: 67%.
 - average fanout = 133
- Typical capacities
 - Height 4: $133^4 = 312,900,700$ records
 - Height 3: $133^3 = 2,352,637$ records
- Can often hold top levels in buffer pool
 - Level 1 = 1 page = 8 Kbytes
 - Level 2 = 133 pages = 1 Mbyte
 - Level 3 = 17,689 pages = 133 Mbytes

CSE 444 - Winter 2018

33

Insertion in a B+ Tree

Insert (K, P)

- Find leaf where K belongs, insert
- If no overflow ($2d$ keys or less), halt
- If overflow ($2d+1$ keys), split node, insert in parent:

- If leaf, also keep K3 in right node
- When root splits, new root has 1 key only

CSE 444 - Winter 2018

34

Insertion in a B+ Tree

Insert K=19

CSE 444 - Winter 2018

35

Insertion in a B+ Tree

After insertion

CSE 444 - Winter 2018

36

Insertion in a B+ Tree

Now insert 25

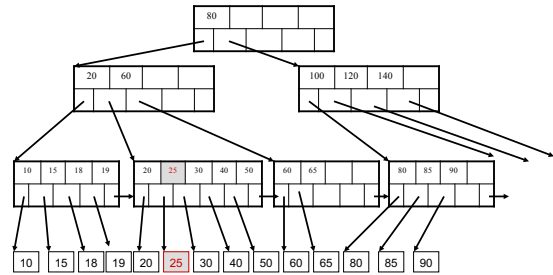

CSE 444 - Winter 2018

37

Insertion in a B+ Tree

After insertion

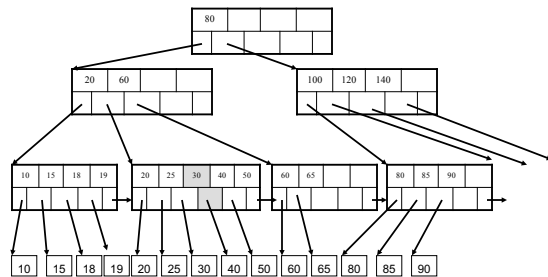

CSE 444 - Winter 2018

38

Insertion in a B+ Tree

But now have to split !

CSE 444 - Winter 2018

39

Insertion in a B+ Tree

After the split

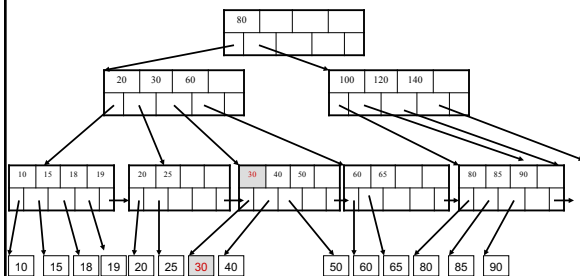

CSE 444 - Winter 2018

40

Deletion from a B+ Tree

Delete 30

CSE 444 - Winter 2018

41

Deletion from a B+ Tree

After deleting 30

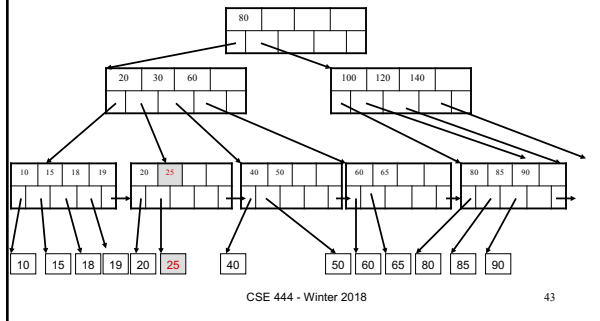

CSE 444 - Winter 2018

42

Deletion from a B+ Tree

Now delete 25

Deletion from a B+ Tree

After deleting 25

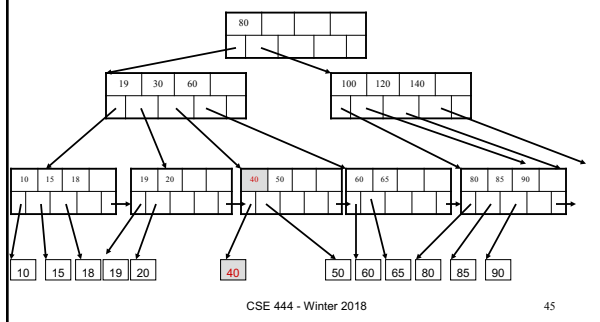

Need to rebalance

Rotate

Deletion from a B+ Tree

Now delete 40

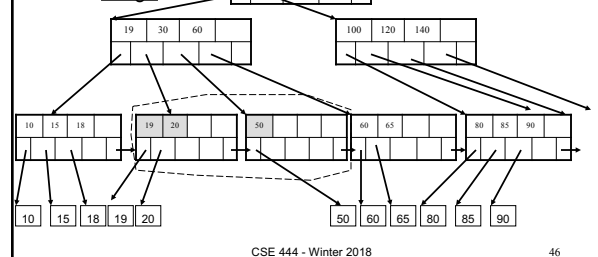

Deletion from a B+ Tree

After deleting 40

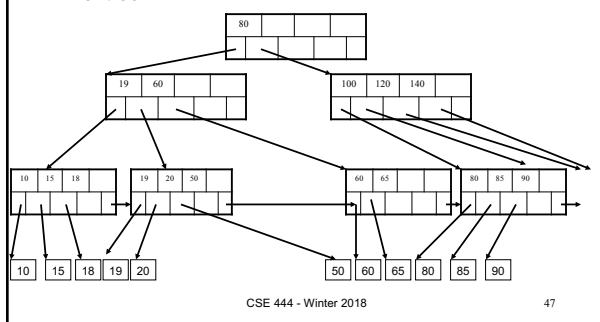

Rotation not possible

Need to *merge* nodes

Deletion from a B+ Tree

Final tree

Summary on B+ Trees

- Default index structure on most DBMSs
- Very effective at answering 'point' queries:
productName = 'gizmo'
- Effective for range queries:
50 < price AND price < 100
- Less effective for multirange:
50 < price < 100 AND 2 < quant < 20

Optional Material

- Let's take a look at another example of an index....

CSE 444 - Winter 2018

49

R-Tree Example

Designed for spatial data

Search key values are bounding boxes

For insertion: at each level, choose child whose bounding box needs least enlargement (in terms of area)

CSE 444 - Winter 2018

50
