Selinger Optimizer History

- 1960's: first database systems
 - Use tree and graph data models
- 1970: Ted Codd proposes relational model
 - E.F. Codd. A relational model of data for large shared data banks. Communications of the ACM, 1970
- 1974: System R from IBM Research
 - One of first systems to implement relational model
- 1979: Seminal query optimizer paper by P. Selinger et. al.
 - Invented cost-based query optimization
 - Dynamic programming algorithm for join order computation

Selinger Algorithm

Selinger enumeration algorithm considers

- Different logical and physical plans *at the same time*
- Cost of a plan is IO + CPU
- Concept of *interesting order* during plan enumeration
 - Same order as that requested by ORDER BY or GROUP BY
 - Or order on attributes that appear in equi-join predicates
 - Because they may enable cheaper sort-merge joins later

CSE 444 - Winter 2018

5

More about the Selinger Algorithm

- Step 1: Enumerate all access paths for a single relation
 - File scan or index scan
 - Keep the cheapest for each *interesting order*
- Step 2: Consider all ways to join two relations
 - Use result from step 1 as the outer relation
 - Consider every other possible relation as inner relation
 - Estimate cost when using sort-merge or nested-loop join
 - Keep the cheapest for each *interesting order*
- Steps 3 and later: Repeat for three relations, etc.

Example From Selinger Paper

| EMP | NAME | DNO | JOB | SAL |
|-----|-------|-----|-----|-------|
| | SMITH | 50 | 12 | 8500 |
| | JONES | 50 | 5 | 15000 |
| | DOE | 51 | 5 | 9500 |

| DEPT | DNO | DNAME | LOC |
|------|-----|----------|---------|
| | 50 | MFG | DENVER |
| | 51 | BILLING | BOULDER |
| | 52 | SHIPPING | DENVER |

| JOB | JOB | TITLE |
|-----|-----|----------|
| | 5 | CLERK |
| | 6 | TYPIST |
| | 8 | SALES |
| | 12 | MECHANIC |

```

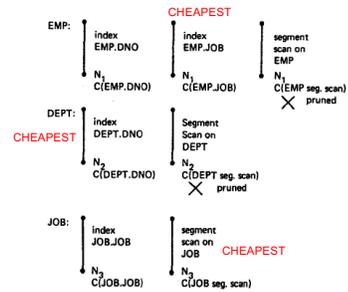

SELECT NAME, TITLE, SAL, DNAME
FROM EMP, DEPT, JOB
WHERE TITLE='CLERK'
AND LOC='DENVER'
AND EMP.DNO=DEPT.DNO
AND EMP.JOB=JOB.JOB
    
```

"Retrieve the name, salary, job title, and department name of employees who are clerks and work for departments in Denver."

Figure 1. JOIN example

Step1: Access Path Selection for Single Relations

- Eligible Predicates: Local Predicates Only
- "Interesting" Orderings: DNO, JOB

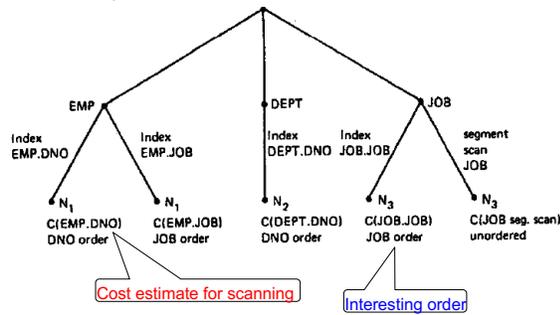

```

SELECT NAME, TITLE, SAL, DNAME
FROM EMP, DEPT, JOB
WHERE TITLE='CLERK' AND LOC='DENVER' AND EMP.DNO=DEPT.DNO AND EMP.JOB=JOB.JOB
    
```

8

Step1: Access Path Selection for Single Relations Resulting Plan Search Tree for Single Relations

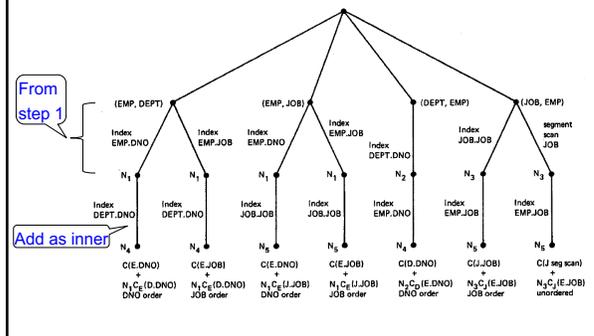

```

SELECT NAME, TITLE, SAL, DNAME
FROM EMP, DEPT, JOB
WHERE TITLE='CLERK' AND LOC='DENVER' AND EMP.DNO=DEPT.DNO AND EMP.JOB=JOB.JOB
    
```

9

Step2: Pairs of Relations (nested loop joins)

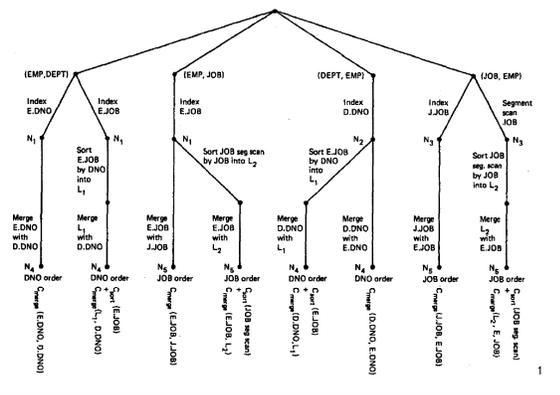

```

SELECT NAME, TITLE, SAL, DNAME
FROM EMP, DEPT, JOB
WHERE TITLE='CLERK' AND LOC='DENVER' AND EMP.DNO=DEPT.DNO AND EMP.JOB=JOB.JOB
    
```

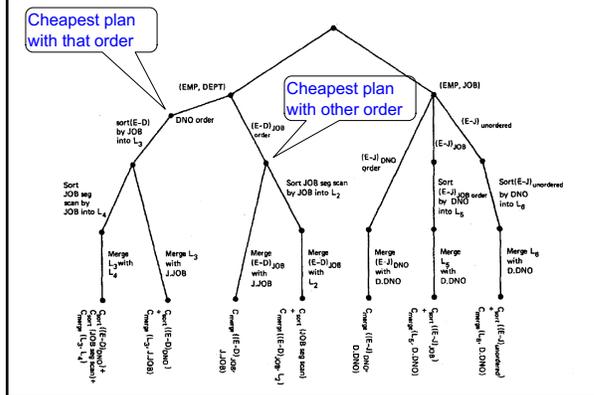

10

Step2: Pairs of Relations (sort-merge joins)

1

Step3: Add Third Relation (sort-merge join)

Dynamic Programming

OrderJoins:

SimpleDB Lab5:
you implement **orderJoins**

R = set of relations to join

For $d = 1$ to N : /* where $N = |R|$ */

For S in {all size- d subsets of R }:

Use: **enumerateSubsets**

optjoin(S) = $(S - a)$ join a ,

where a is the single relation that minimizes:

$\text{cost}(\text{optjoin}(S - a)) +$

Use:
computerCostAndCardOfSubplan

$\text{min.cost to join } (S - a) \text{ with } a +$

$\text{min.access cost for } a$

Note: **optjoin**(S - a) is cached from previous iterations

CSE 444 - Winter 2018

16

Example

- **orderJoins(A, B, C, D)**
- Assume all joins are NL

| Subplan S | optJoin(S) | Cost(OptJoin(S)) |
|-----------|------------|------------------|
| A | | |

CSE 444 - Winter 2018

17

Example

- **orderJoins(A, B, C, D)**
- Assume all joins are NL

| Subplan S | optJoin(S) | Cost(OptJoin(S)) |
|-----------|-------------|------------------|
| A | Index scan | 100 |
| B | Seq. scan | 50 |
| C | Seq scan | 120 |
| D | B+tree scan | 400 |

- $d = 1$
 - A = best way to access A (sequential scan, predicate-pushdown on index, etc)
 - B = best way to access B
 - C = best way to access C
 - D = best way to access D
- Total number of steps: choose(N , 1)

CSE 444 - Winter 2018

18

Example

- **orderJoins(A, B, C, D)**

- $d = 2$
 - {A,B} = AB or BA use previously computed best way to access A and B

| Subplan S | optJoin(S) | Cost(OptJoin(S)) |
|-----------|------------|------------------|
| A | Index scan | 100 |
| B | Seq. scan | 50 |
| ... | | |
