# CSE 444: Database Internals Lecture 27 NewSQL

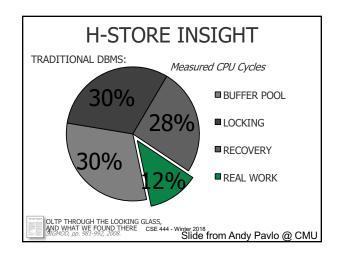

## Some Popular NewSQL Systems

CSE 444 - Winter 2018

- H-Store
  - Research system from Brown U., MIT, CMU, and Yale
  - Commercialized as VoltDB
- Hekaton
  - Microsoft
  - Fully integrated into SQL Server
- Hyper
  - Hybrid OLTP/OLAP
  - Research system from TU Munich. Bought by Tableau
- Spanner
  - Google

CSE 444 - Winter 2018

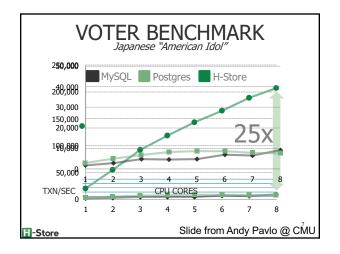

# H-Store Key Ideas

- · Main-memory storage
  - Avoids disk IO costs / buffer pool costs
  - Durability through snapshots + cmd log
  - Replication
- · Serial execution
  - One database partition per thread on one core
  - Avoid overheads related to locking
- · All transactions are stored procedures
  - Command logging avoids heavy recovery overheads
- · Avoid distributed transactions
  - But when needed, run 2PC

CSE 444 - Winter 2018

STORED PROCEDURE VoteCount: InsertVote: SELECT COUNT(\*) INSERT INTO votes FROM votes VALUES (?, ?, ?); WHERE phone\_num = ?; run(phoneNum, contestantId, currentTime) { result = execute(VoteCount, phoneNum); if (result > MAX\_VOTES) { return (ERROR); execute(InsertVote, phoneNum, contestantId, currentTime); return (SUCCESS); Slide from Andy Pavlo @ CMU

1

### Hekaton

- · Focus: DBMS with large main memories and many core CPUs
- · Integrated with SQL Server
- · Key user-visible features
  - Simply declare a table "memory resident"
  - Hekaton tables are fully durable and transactional, though non-durable tables are also supported
  - Query can touch both Hekaton and regular tables

CSE 444 - Winter 2018

# **Hekaton Key Details**

- · Idea: To increase transaction throughput must decrease number of instructions / transaction
- · Main-memory DBMS
  - Optimize indexes for memory-resident data
  - Durability by logging and checkpointing records to external storage
- · No partitioning
  - Any thread can touch any row of any table
- · No locking
  - Uses a new MVCC method for isolation

CSE 444 - Winter 2018

### **Hekaton More Details**

- · Optimized stored procedures
  - Compile statements and stored procedures into customized, highly efficient machine code

CSE 444 - Winter 2018

10

# Hyper

- · Hybrid OLTP and OLAP
- · In-memory data management
  - Including optimized indexes for memory-resident data
  - Data compression for cold data
- · Data-centric code generation
  - SQL translated to LLVM
- · OLAP separated from OLTP using MVCC
- Exploits hardware transactional memory
- · Data shuffling and distribution optimizations

CSE 444 - Winter 2018

### Conclusion

- · Many innovations recently in
  - Big data analytics
  - Transaction processing at very large scale
- · Many more problems remain open
- · This course teaches foundations
- · Innovate with an open mind!
