

CSE 444: Database Internals

Lecture 12 Query Optimization (part 3)

Announcements

- Lab 2 due tomorrow
- Lab 1 grades out today:
 - Some student's codes wouldn't compile on attu, in your feedback it will say to email your TA.
- HW 5 due Monday – application of techniques in lecture
- Quiz 1+2 on Monday

Selinger Optimizer History

- 1960's: first database systems
 - Use tree and graph data models
- 1970: Ted Codd proposes relational model
 - E.F. Codd. A relational model of data for large shared data banks. Communications of the ACM, 1970
- 1974: System R from IBM Research
 - One of first systems to implement relational model
- 1979: Seminal query optimizer paper by P. Selinger et. al.
 - Invented cost-based query optimization
 - Dynamic programming algorithm for join order computation

References

- P. Selinger, M. Astrahan, D. Chamberlin, R. Lorie, and T. Price. Access Path Selection in a Relational Database Management System. Proceedings of ACM SIGMOD, **1979**. Pages 22-34.

Selinger Algorithm

Selinger enumeration algorithm considers

- Different logical and physical plans *at the same time*
- Cost of a plan is IO + CPU
- Concept of *interesting order* during plan enumeration
 - A *sorted order* as that requested by ORDER BY or GROUP BY
 - Or order on attributes that appear in equi-join predicates
 - Because they may enable cheaper sort-merge joins later

More about the Selinger Algorithm

- Step 1: Enumerate all access paths for a single relation
 - File scan or index scan
 - Keep the cheapest for each *interesting order*
- Step 2: Consider all ways to join two relations
 - Use result from step 1 as the outer relation
 - Consider every other possible relation as inner relation
 - Estimate cost when using sort-merge or nested-loop join
 - Keep the cheapest for each *interesting order*
- Steps 3 and later: Repeat for three relations, etc.

Example From Selinger Paper

EMP

	NAME	DNO	JOB	SAL
SMITH	50	12	8500	
JONES	50	5	15000	
DOE	51	5	9500	

DEPT

DNO	DNAME	LOC
50	MFG	DENVER
51	BILLING	BOULDER
52	SHIPPING	DENVER

JOB

JOB	TITLE
5	CLERK
6	TYPIST
8	SALES
12	MECHANIC

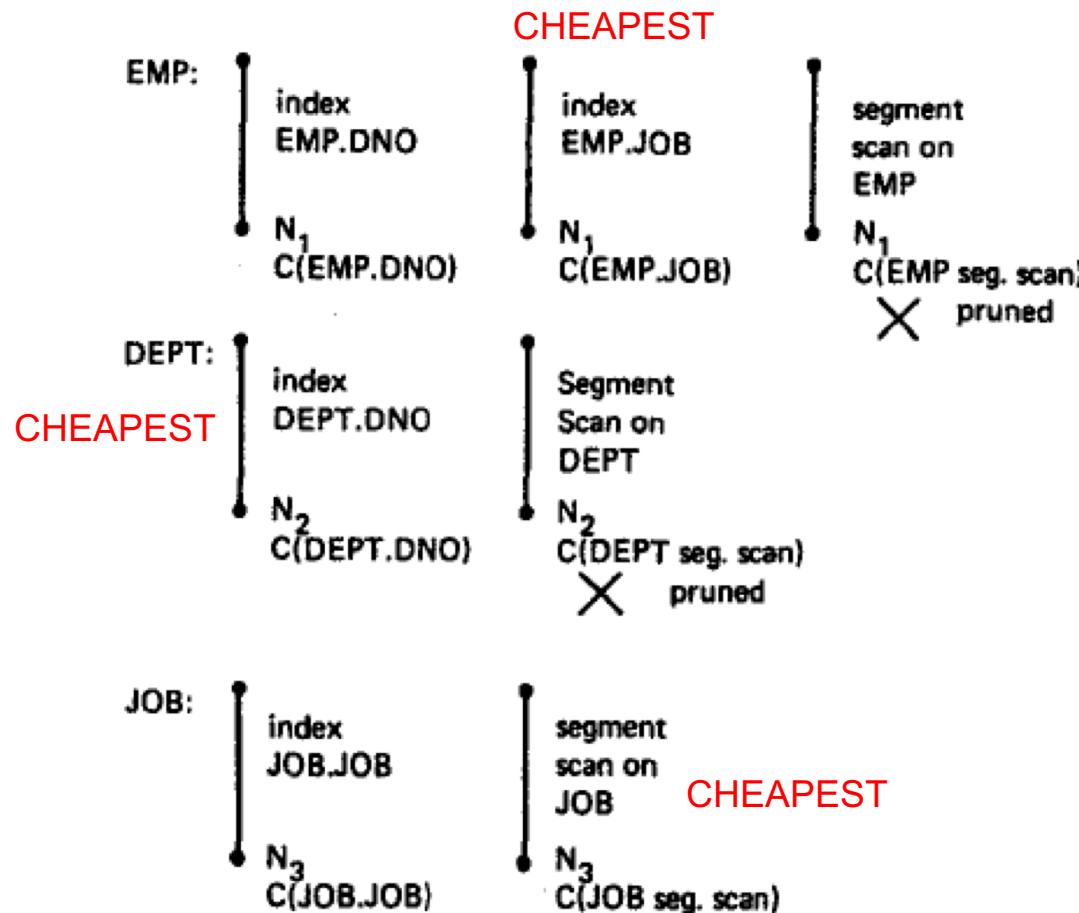

```
SELECT NAME, TITLE, SAL, DNAME  
FROM EMP, DEPT, JOB  
WHERE TITLE='CLERK'  
AND LOC='DENVER'  
AND EMP.DNO=DEPT.DNO  
AND EMP.JOB=JOB.JOB
```

“Retrieve the name, salary, job title, and department name of employees who are clerks and work for departments in Denver.”

Figure 1. JOIN example

Step1: Access Path Selection for Single Relations

- Eligible Predicates: Local Predicates Only
- “Interesting” Orderings: DNO, JOB

```

SELECT  NAME, TITLE, SAL, DNAME
FROM    EMP, DEPT, JOB
WHERE   TITLE='CLERK'
        AND LOC='DENVER'
        AND EMP.DNO=DEPT.DNO
        AND EMP.JOB=JOB.JOB
  
```

“Retrieve the name, salary, job title, and department name of employees who are clerks and work for departments in Denver.”

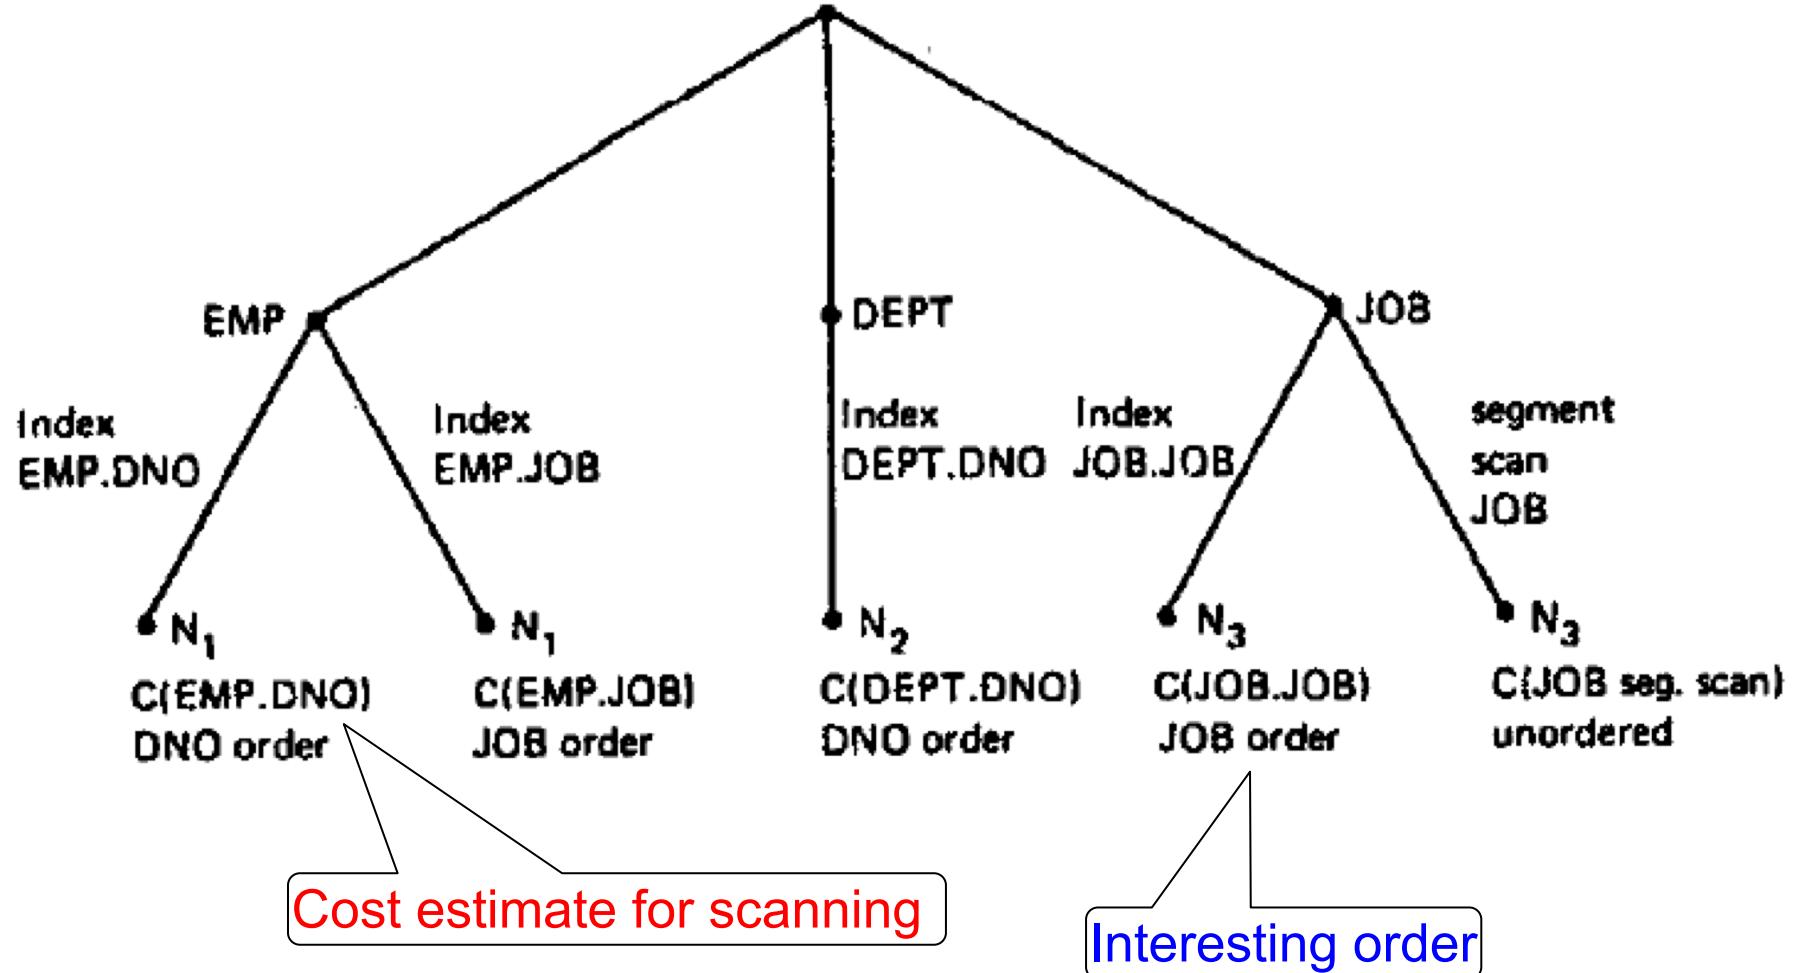

Figure 1. JOIN example

```

SELECT NAME, TITLE, SAL, DNAME
FROM EMP, DEPT, JOB
WHERE TITLE='CLERK' AND LOC='DENVER' AND EMP.DNO=DEPT.DNO AND EMP.JOB=JOB.JOB
  
```

Step1: Access Path Selection for Single Relations

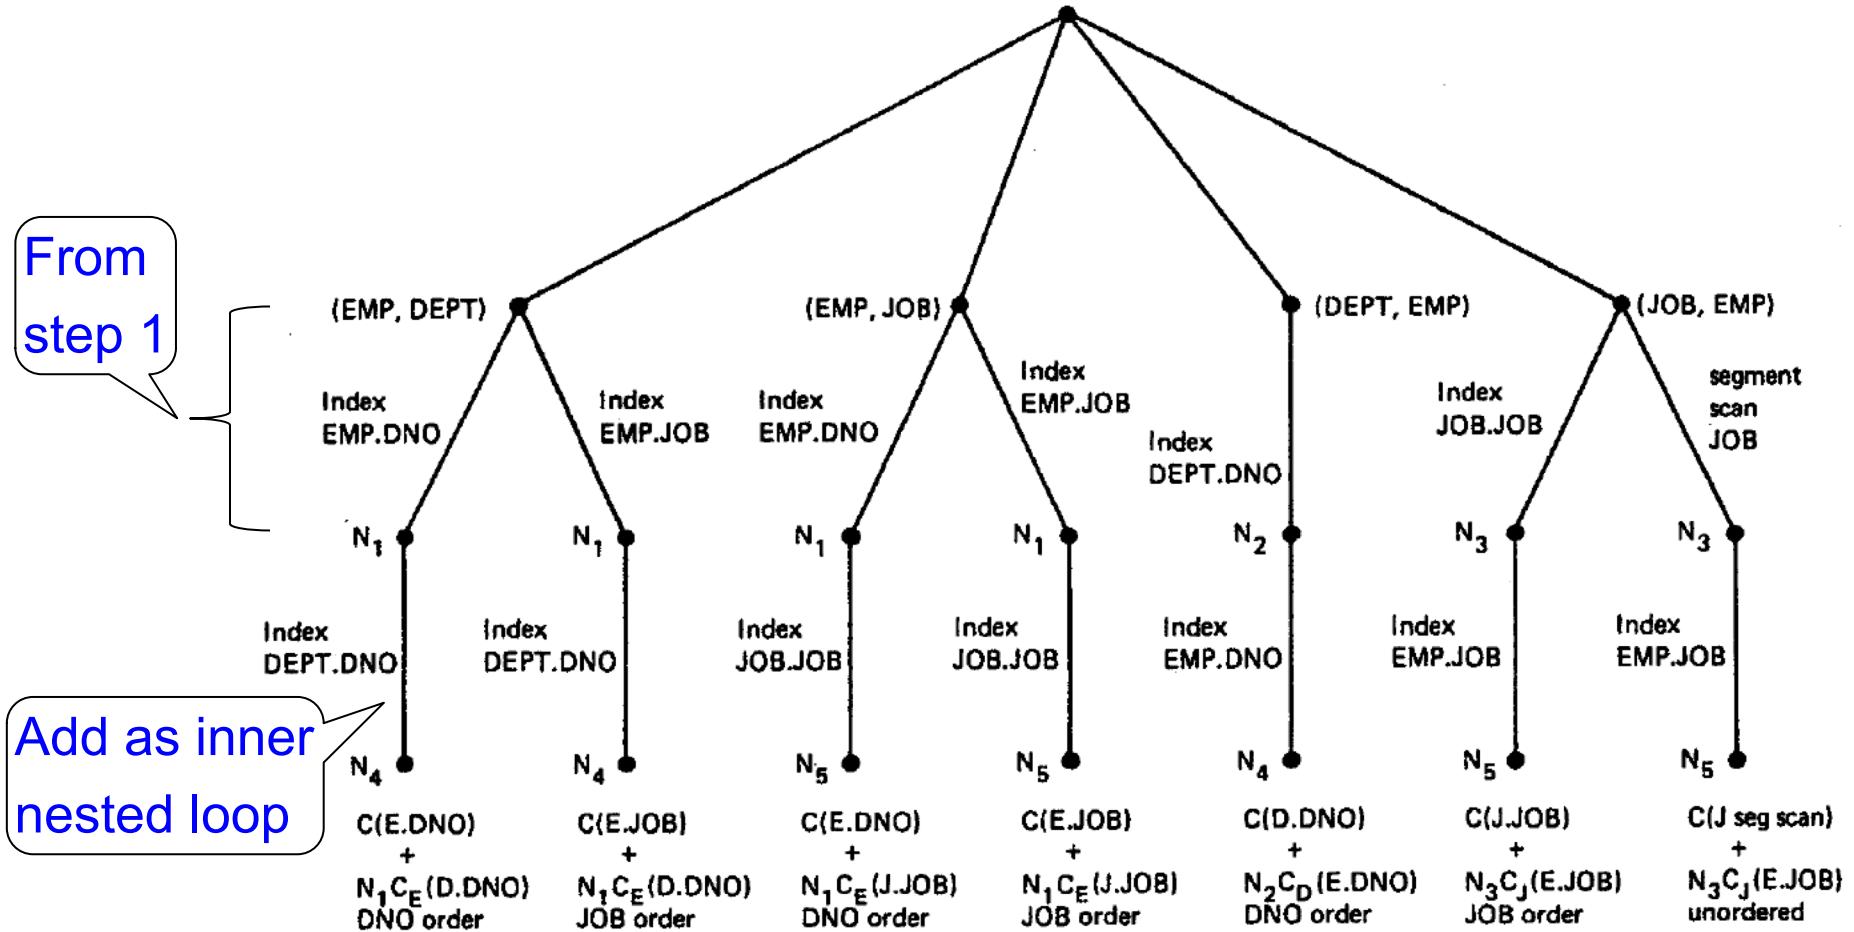

Resulting Plan Search Tree for Single Relations

```

SELECT NAME, TITLE, SAL, DNAME
FROM EMP, DEPT, JOB
WHERE TITLE='CLERK' AND LOC='DENVER' AND EMP.DNO=DEPT.DNO AND EMP.JOB=JOB.JOB
    
```

Step2: Pairs of Relations (nested loop joins)

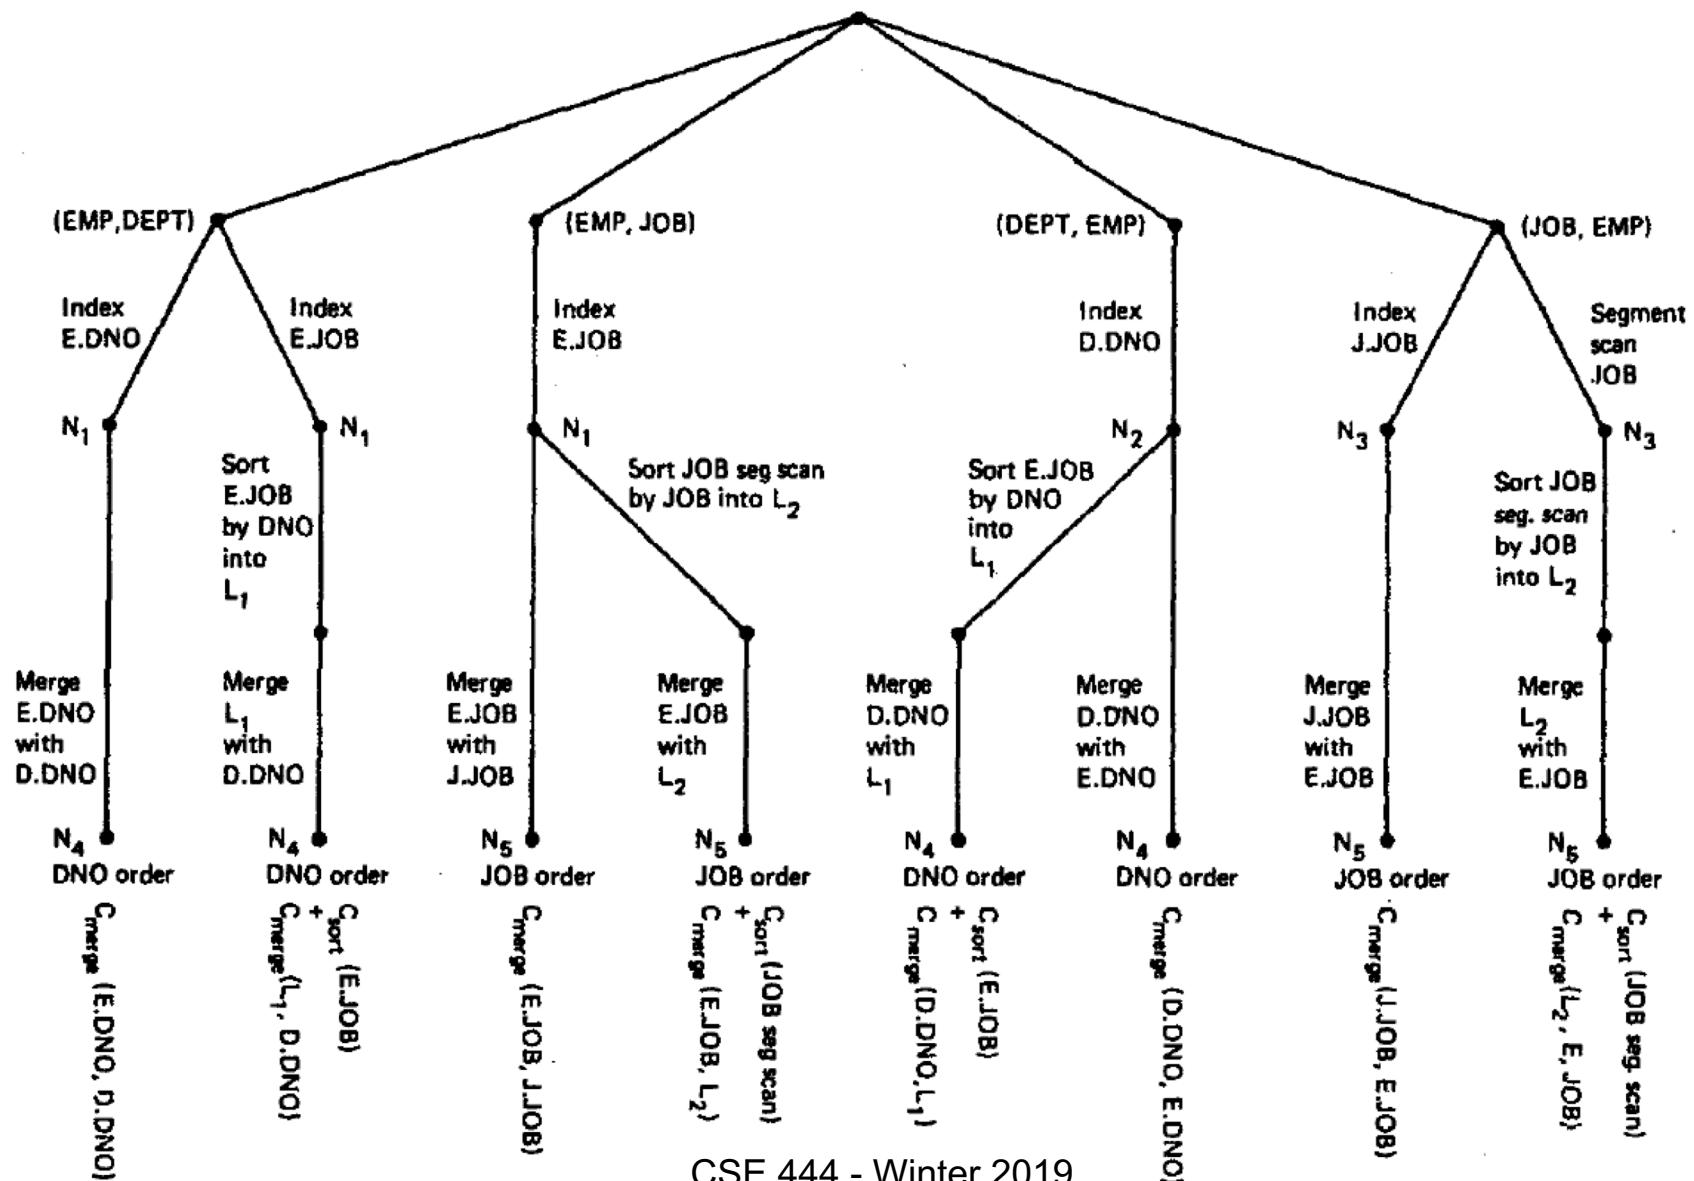

SELECT NAME, TITLE, SAL, DNAME

FROM EMP, DEPT, JOB

WHERE TITLE='CLERK' AND LOC='DENVER' AND EMP.DNO=DEPT.DNO AND EMP.JOB=JOB.JOB

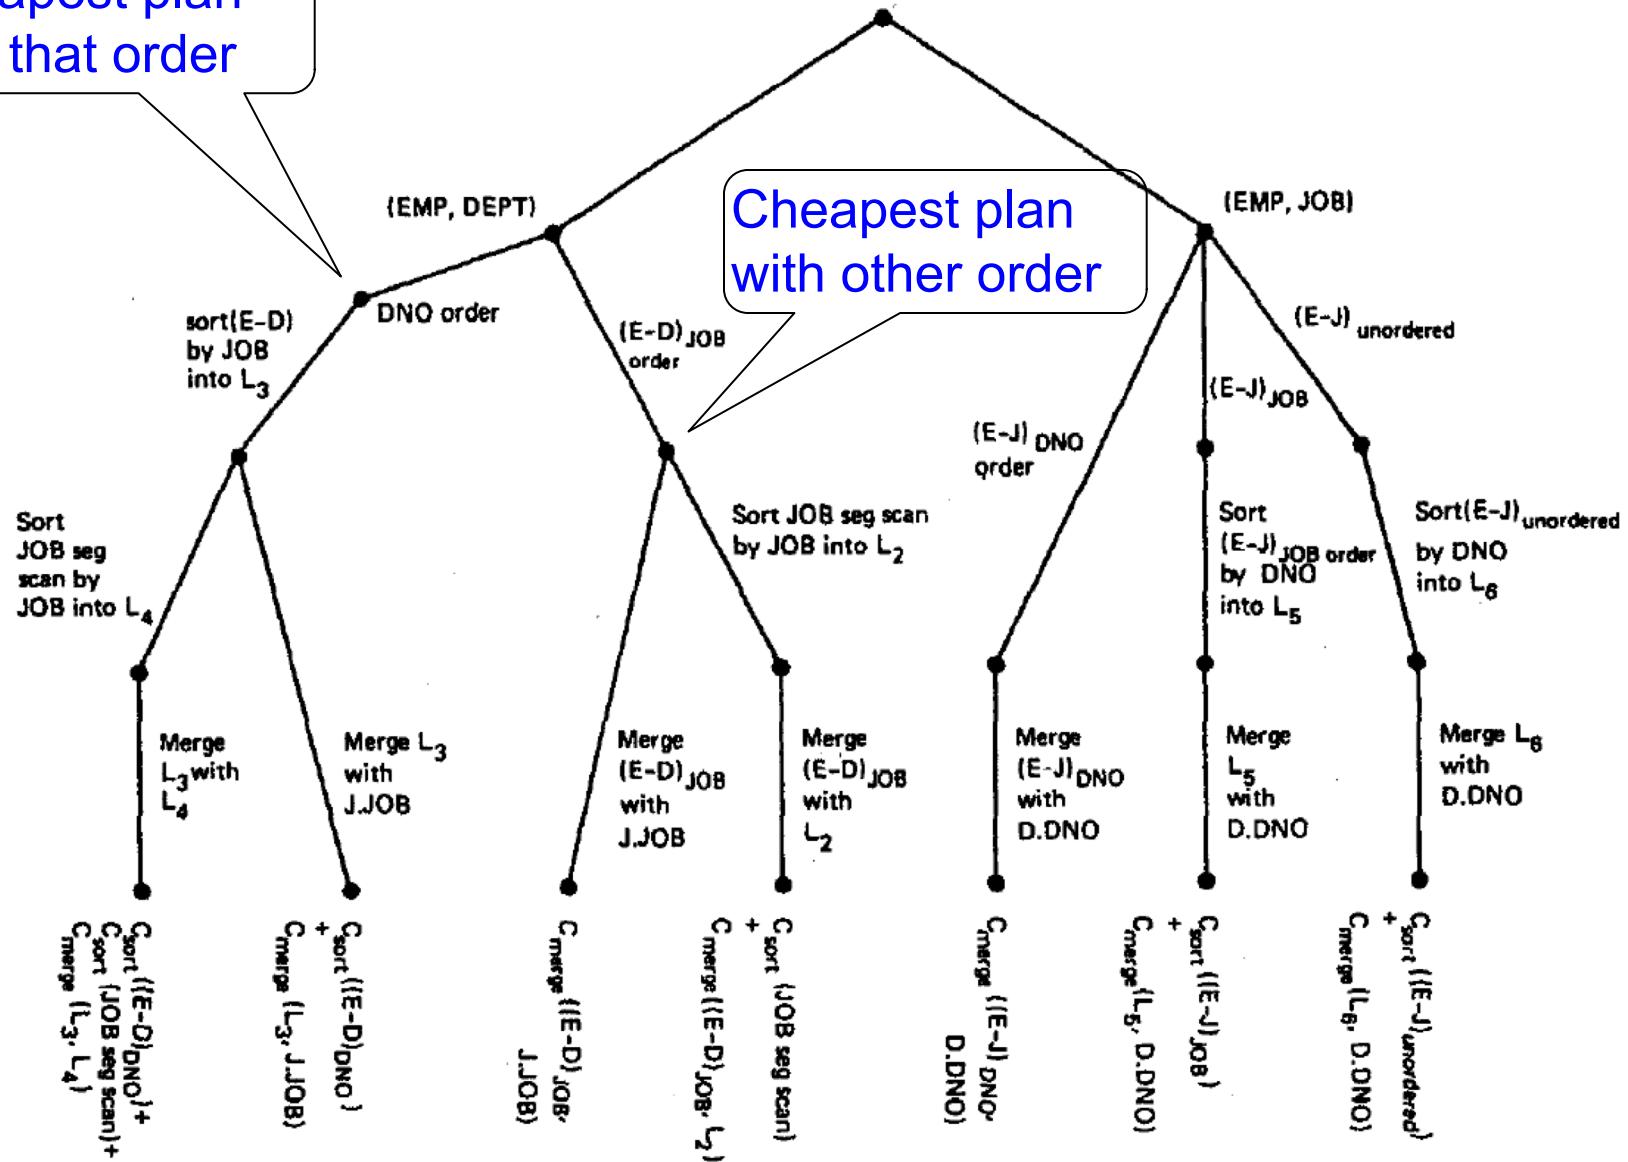

Step2: Pairs of Relations (sort-merge joins)

Step3: Add Third Relation (sort-merge join)

Cheapest plan
with that order

Cheapest plan
with other order

Next Example Acks

Implement variant of Selinger optimizer in SimpleDB

Designed to help you with Lab 5

Many following slides from Sam Madden at MIT

Dynamic Programming

OrderJoins(...):

SimpleDB Lab5:
you implement `orderJoins`

R = set of relations to join

For $d = 1$ to N : /* where $N = |R|$ */

For S in {all size- d subsets of R }:

Use: `enumerateSubsets`

optjoin(S) = $(S - a)$ join a ,

where a is the single relation that minimizes:

$\text{cost}(\text{optjoin}(S - a)) +$

Use:
`computeCostAndCardOfSubplan`

min.cost to join $(S - a)$ with a +

min.access cost for a

Note: **optjoin**($S-a$) is cached from previous iterations

Example

- **orderJoins(A, B, C, D)**
- Assume all joins are Nested Loop

Subplan S	optJoin(S)	Cost(OptJoin(S))
A		

Example

- **orderJoins(A, B, C, D)**
- Assume all joins are NL
- $d = 1$
 - A = best way to access A
(sequential scan, predicate-pushdown on index, etc)
 - B = best way to access B
 - C = best way to access C
 - D = best way to access D
- Total number of steps: $\text{choose}(N, 1)$

Subplan S	optJoin(S)	Cost(OptJoin(S))
A	Index scan	100
B	Seq. scan	50
C	Seq scan	120
D	B+tree scan	400

Example

- **orderJoins(A, B, C, D)**
- $d = 2$
 - $\{A,B\} = AB \text{ or } BA$
use previously computed
best way to access A and B

Subplan S	optJoin(S)	Cost(OptJoin(S))
A	Index scan	100
B	Seq. scan	50
...		

Example

- **orderJoins(A, B, C, D)**
- $d = 2$
 - $\{A, B\} = AB \text{ or } BA$
use previously computed
best way to access A and B

Subplan S	optJoin(S)	Cost(OptJoin(S))
A	Index scan	100
B	Seq. scan	50
...		
{A, B}	BA	156

Example

- **orderJoins(A, B, C, D)**
- $d = 2$
 - $\{A, B\} = AB \text{ or } BA$
use previously computed
best way to access A and B
 - $\{B, C\} = BC \text{ or } CB$

Subplan S	optJoin(S)	Cost(OptJoin(S))
A	Index scan	100
B	Seq. scan	50
...		
{A, B}	BA	156
{B, C}	BC	98

Example

- **orderJoins(A, B, C, D)**

- $d = 2$

- $\{A, B\} = AB \text{ or } BA$
use previously computed
best way to access A and B
 - $\{B, C\} = BC \text{ or } CB$

Subplan S	optJoin(S)	Cost(OptJoin(S))
A	Index scan	100
B	Seq. scan	50
...		
{A, B}	BA	156
{B, C}	BC	98

Example

- **orderJoins(A, B, C, D)**

- $d = 2$
 - $\{A,B\} = AB \text{ or } BA$
use previously computed
best way to access A and B
 - $\{B,C\} = BC \text{ or } CB$
 - $\{C,D\} = CD \text{ or } DC$
 - $\{A,C\} = AC \text{ or } CA$
 - $\{B,D\} = BD \text{ or } DB$
 - $\{A,D\} = AD \text{ or } DA$

Subplan S	optJoin(S)	Cost(OptJoin(S))
A	Index scan	100
B	Seq. scan	50
...		
{A, B}	BA	156
{B, C}	BC	98
.....		

Example

- **orderJoins(A, B, C, D)**

- $d = 2$
 - $\{A,B\} = AB \text{ or } BA$
use previously computed
best way to access A and B
 - $\{B,C\} = BC \text{ or } CB$
 - $\{C,D\} = CD \text{ or } DC$
 - $\{A,C\} = AC \text{ or } CA$
 - $\{B,D\} = BD \text{ or } DB$
 - $\{A,D\} = AD \text{ or } DA$

Subplan S	optJoin(S)	Cost(OptJoin(S))
A	Index scan	100
B	Seq. scan	50
...		
{A, B}	BA	156
{B, C}	BC	98
.....		

Example

- **orderJoins(A, B, C, D)**

- $d = 3$

- $\{A, B, C\} =$

Remove A: compare $A(\{B,C\})$ to $(\{B,C\})A$

Subplan S	optJoin(S)	Cost(OptJoin(S))
A	Index scan	100
B	Seq. scan	50
....		
{A, B}	BA	156
{B, C}	BC	98
....		

Example

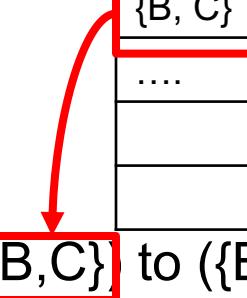

- **orderJoins(A, B, C, D)**

- $d = 3$

- $\{A, B, C\} =$

- Remove A: compare $A(\boxed{B,C})$ to $(\{B,C\})A$

Subplan S	optJoin(S)	Cost(OptJoin(S))
A	Index scan	100
B	Seq. scan	50
....		
{A, B}	BA	156
{B, C}	BC	98
....		

optJoin(B,C)
and its cost are
already cached
in table

Example

- **orderJoins(A, B, C, D)**

- $d = 3$

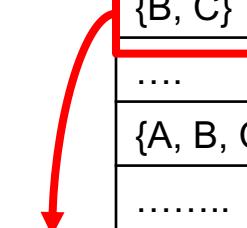

- $\{A, B, C\} =$

Remove A: compare $A(\boxed{B,C})$ to $(\{B,C\})A$

Remove B: compare $B(\{A,C\})$ to $(\{A,C\})B$

Remove C: compare $C(\{A,B\})$ to $(\{A,B\})C$

Subplan S	optJoin(S)	Cost(OptJoin(S))
A	Index scan	100
B	Seq. scan	50
....		
{A, B}	BA	156
{B, C}	BC	98
....		
{A, B, C}	BAC	500
.....		

optJoin(B,C)
and its cost are
already cached
in table

Example

- **orderJoins(A, B, C, D)**

- $d = 3$

– $\{A, B, C\} =$

Remove A: compare $A(\{B, C\})$ to $(\{B, C\})A$

Remove B: compare $B(\{A, C\})$ to $(\{A, C\})B$

Remove C: compare $C(\{A, B\})$ to $(\{A, B\})C$

Subplan S	optJoin(S)	Cost(OptJoin(S))
A	Index scan	100
B	Seq. scan	50
....		
{A, B}	BA	156
{B, C}	BC	98
....		
{A, B, C}	BAC	500
.....		

optJoin(B,C)
and its cost are
already cached
in table

Example

- **orderJoins(A, B, C, D)**

- $d = 3$

– $\{A, B, C\} =$

Remove A: compare $A(\{B, C\})$ to $(\{B, C\})A$

Remove B: compare $B(\{A, C\})$ to $(\{A, C\})B$

Remove C: compare $C(\{A, B\})$ to $(\{A, B\})C$

– $\{A, B, D\} =$

Remove A: compare $A(\{B, D\})$ to $(\{B, D\})A$

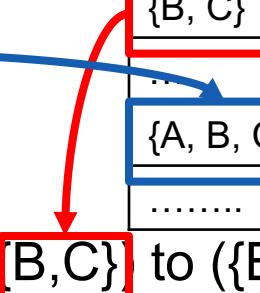

...

– $\{A, C, D\} = \dots$

– $\{B, C, D\} = \dots$

- Total number of steps: $\text{choose}(N, 3) \times 3 \times 2$

Subplan S	optJoin(S)	Cost(OptJoin(S))
A	Index scan	100
B	Seq. scan	50
....		
{A, B}	BA	156
{B, C}	BC	98
....		
{A, B, C}	BAC	500
.....		

optJoin(B,C)
and its cost are
already cached
in table

Example

- **orderJoins(A, B, C, D)**

- $d = 4$
 - $\{A, B, C, D\} =$

Subplan S	optJoin(S)	Cost(OptJoin(S))
A	Index scan	100
B	Seq. scan	50
{A, B}	BA	156
{B, C}	BC	98
{A, B, C}	BAC	500
{B, C, D}	DBC	150
.....		

Remove A: compare A **{B, C, D}** to $(\{B, C, D\})A$

Remove B: compare B $(\{A, C, D\})$ to $(\{A, C, D\})B$

Remove C: compare C $(\{A, B, D\})$ to $(\{A, B, D\})C$

Remove D: compare D $(\{A, B, C\})$ to $(\{A, B, C\})D$

optJoin(B, C, D)
and its cost are
already cached
in table

- Total number of steps: $\text{choose}(N, 4) \times 4 \times 2$

Implementation in SimpleDB (lab5)

1. JoinOptimizer.java (and the classes used there)

2. Returns vector of “LogicalJoinNode”

Two base tables, two join attributes, predicate

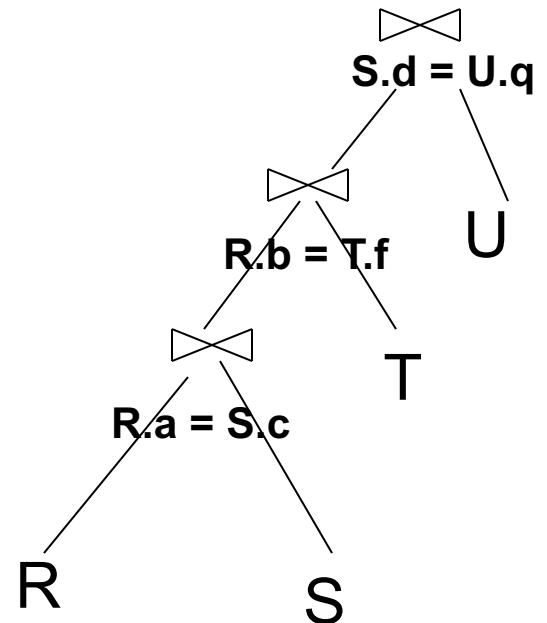

e.g. $R(a, b)$, $S(c, d)$, $T(a, f)$, $U(p, q)$

$(R, S, R.a, S.c, =)$

Recall that SimpleDB keeps all attributes of
 R, S after their join $R.a, R.b, S.c, S.d$

3. Output vector looks like:

$\langle (R, S, R.a, S.c), (R, T, R.b, T.f), (S, U, S.d, U.q) \rangle$

Implementation in SimpleDB (lab5)

Any advantage of returning pairs?

- Flexibility to consider all linear plans
 $\langle(R, S, R.a, S.c), (R, T, R.b, T.f), (U, S, U.q, S.d)\rangle$

More Details:

- You mainly need to implement “`orderJoins(..)`”
- “`CostCard`” data structure stores a plan, its cost and cardinality: you would need to estimate them
- “`PlanCache`” stores the table in dyn. Prog:

Maps a set of LJN to
a vector of LJN (best plan for the vector),
its cost, and its cardinality

LJN = LogicalJoinNode
