CSE 444: Database Internals

Lectures 14
Transactions: Locking

CSE 444 - Winter 2019

Announcements

- Many changes have been made to assignments due dates because of snow days
 - Calendar on course web page has up-to-date information
- Will skip timestamp-based concurrency control material to catch up schedule

CSE 444 - Winter 2019

Schedules with Aborted Transactions

Commit

Abort

Cannot abort T1 because cannot undo T2

Recoverable Schedules

A schedule is recoverable if:

- · It is conflict-serializable, and
- Whenever a transaction T commits, all transactions that have written elements read by T have already committed

CSE 444 - Winter 2019

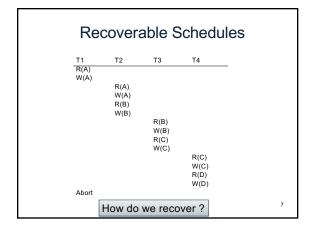

Recoverable Schedules

A schedule is recoverable if:

- · It is conflict-serializable, and
- Whenever a transaction T commits, all transactions that have written elements read by T have already committed

CSE 444 - Winter 2019

Recoverable Schedules

Cascading Aborts

- If a transaction T aborts, then we need to abort any other transaction T' that has read an element written by T
- · A schedule avoids cascading aborts if whenever a transaction reads an element, the transaction that has last written it has already committed.

CSE 444 - Winter 2019

Avoiding Cascading Aborts T2 T2 R(A) R(A) W(A) W(A) Commit W(A) R(B) W(A) W(B) R(B) W(B) With cascading aborts Without cascading aborts CSE 444 - Winter 2019

Review of Schedules

Serializability

Recoverability

- Serial
- Serializable
- Conflict serializable
- View serializable
- Recoverable
- · Avoids cascading aborts

CSE 444 - Winter 2019

Scheduler

- · The scheduler:
- · Module that schedules the transaction's actions, ensuring serializability
- Two main approaches
- Pessimistic: locks
- Optimistic: timestamps, multi-version, validation

CSE 444 - Winter 2019

Pessimistic Scheduler

Simple idea:

- Each element has a unique lock
- Each transaction must first acquire the lock before reading/writing that element
- · If the lock is taken by another transaction, then wait
- The transaction must release the lock(s)

CSE 444 - Winter 2019

Notation

 $L_i(A)$ = transaction T_i acquires lock for element A $U_i(A)$ = transaction T_i releases lock for element A

CSE 444 - Winter 2019

13

CSE 444 - Winter 2019

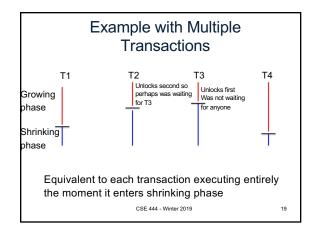

```
But\dots
T1 \qquad T2
\overline{L_1(A); READ(A, t)}
t := t+100
WRITE(A, t); U_1(A);
L_2(A); READ(A,s)
s := s*2
WRITE(A,s); U_2(A);
L_2(B); READ(B,s)
s := s*2
WRITE(B,s); U_2(B);
L_1(B); READ(B, t)
t := t+100
WRITE(B,t); U_1(B);
Locks did not enforce conflict-serializability !!! What's wrong?
```

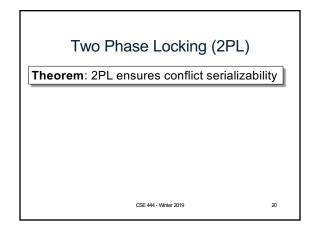

Two Phase Locking (2PL)

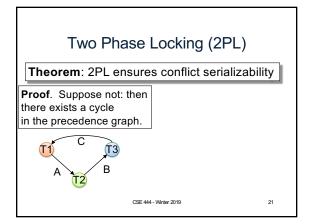

The 2PL rule:

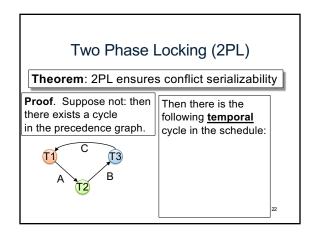

- In every transaction, all lock requests must precede all unlock requests
- This ensures conflict serializability ! (will prove this shortly)

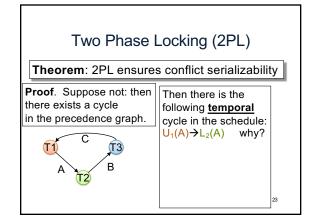

CSE 444 - Winter 2019

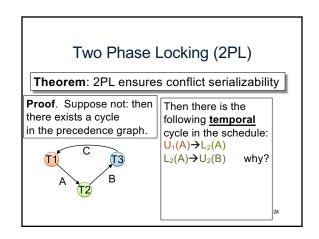

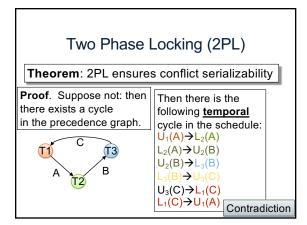

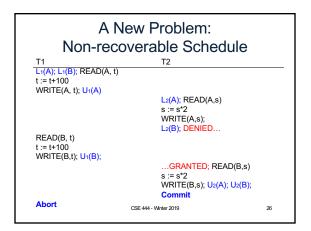

Strict 2PL

- Strict 2PL: All locks held by a transaction are released when the transaction is completed; release happens at the time of COMMIT or ROLLBACK
- · Schedule is recoverable
- · Schedule avoids cascading aborts
- Schedule is strict: read book

CSE 444 - Winter 2019

Summary of Strict 2PL

- Ensures serializability, recoverability, and avoids cascading aborts
- Issues: implementation, lock modes, granularity, deadlocks, performance

CSE 444 - Winter 2019

29

The Locking Scheduler

Task 1: -- act on behalf of the transaction

Add lock/unlock requests to transactions

- Examine all READ(A) or WRITE(A) actions
- · Add appropriate lock requests
- On COMMIT/ROLLBACK release all locks
- · Ensures Strict 2PL!

CSE 444 - Winter 2019 30

The Locking Scheduler

Task 2: -- act on behalf of the system Execute the locks accordingly

- · Lock table: a big, critical data structure in a DBMS!
- · When a lock is requested, check the lock table - Grant, or add the transaction to the element's wait list
- When a lock is released, re-activate a transaction from its wait list
- · When a transaction aborts, release all its locks
- · Check for deadlocks occasionally

CSE 444 - Winter 2019

Lock Modes

- S = shared lock (for READ)
- X = exclusive lock (for WRITE)

Lock compatibility matrix:

	None	S	X
None	OK	OK	OK
S	OK	OK	Conflict
X	OK	Conflict	Conflict

CSE 444 - Winter 2019

Lock Granularity

- Fine granularity locking (e.g., tuples)
 - High concurrency
 - High overhead in managing locks
- Coarse grain locking (e.g., tables, predicate locks)
 - Many false conflicts
 - Less overhead in managing locks

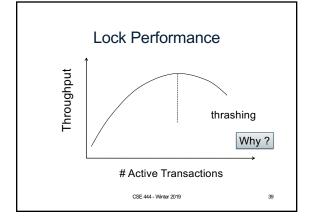

CSE 444 - Winter 2019

33

Deadlocks

- Cycle in the wait-for graph:
 - T1 waits for T2
 - T2 waits for T3
 - T3 waits for T1
- · Deadlock detection
 - Timeouts
- Wait-for graph
- Deadlock avoidance
 - Acquire locks in pre-defined order
 - Acquire all locks at once before starting

CSE 444 - Winter 2019

Phantom Problem

- So far we have assumed the database to be a static collection of elements (=tuples)
- If tuples are inserted/deleted then the phantom problem appears

CSE 444 - Winter 2019

Phantom Problem

T2 T1

SELECT FROM Product WHERE color='blue'

INSERT INTO Product(name, color)

43

VALUES ('gizmo', 'blue')

SELECT * FROM Product WHERE color='blue'

Is this schedule serializable?

CSE 444 - Winter 2019

Phantom Problem

T2

SELECT FROM Product WHERE color='blue'

T1

INSERT INTO Product(name, color)

VALUES ('gizmo', 'blue')

SELECT * FROM Product WHERE color='blue'

Suppose there are two blue products, X1, X2:

R1(X1),R1(X2),W2(X3),R1(X1),R1(X2),R1(X3)

CSE 444 - Winter 2019

T1

Phantom Problem

T1 T2

SELECT FROM Product WHERE color='blue'

INSERT INTO Product(name, color)

VALUES ('gizmo', 'blue')

SELECT * FROM Product WHERE color='blue'

Suppose there are two blue products, X1, X2:

R1(X1),R1(X2),W2(X3),R1(X1),R1(X2),R1(X3)

This is conflict serializable! What's wrong??

Phantom Problem

T2

SELECT FROM Product WHERE color='blue'

INSERT INTO Product(name, color)

VALUES ('gizmo', 'blue')

SELECT * FROM Product WHERE color='blue'

Suppose there are two blue products, X1, X2:

R1(X1),R1(X2),W2(X3),R1(X1),R1(X2),R1(X3)

Not serializable due to *phantoms*

Phantom Problem

- · A "phantom" is a tuple that is invisible during part of a transaction execution but not invisible during the entire execution
- · In our example:
 - T1: reads list of products
 - T2: inserts a new product
 - T1: re-reads: a new product appears!

CSE 444 - Winter 2019

Phantom Problem

- In a static database:
 - Conflict serializability implies serializability
- In a dynamic database, this may fail due to phantoms
- · Strict 2PL guarantees conflict serializability, but not serializability

CSE 444 - Winter 2019

Dealing With Phantoms

- · Lock the entire table, or
- · Lock the index entry for 'blue'
 - If index is available
- · Or use predicate locks
 - A lock on an arbitrary predicate

Dealing with phantoms is expensive!

CSE 444 - Winter 2019

Isolation Levels in SQL

- 1. "Dirty reads" SET TRANSACTION ISOLATION LEVEL READ UNCOMMITTED
- "Committed reads" SET TRANSACTION ISOLATION LEVEL READ COMMITTED
- "Repeatable reads" SET TRANSACTION ISOLATION LEVEL REPEATABLE READ
- ACID) Serializable transactions SET TRANSACTION ISOLATION LEVEL SERIALIZABLE CSE 444 - Winter 2019

1. Isolation Level: Dirty Reads

- · "Long duration" WRITE locks
 - Strict 2PL
- No READ locks
 - Read-only transactions are never delayed

Possible pbs: dirty and inconsistent reads

CSE 444 - Winter 2019

2. Isolation Level: Read Committed

- "Long duration" WRITE locks
 - Strict 2PL
- "Short duration" READ locks
 - Only acquire lock while reading (not 2PL)

Unrepeatable reads When reading same element twice, may get two different values

CSE 444 - Winter 2019

3. Isolation Level: Repeatable Read

- · "Long duration" WRITE locks
 - Strict 2PL
- · "Long duration" READ locks
 - Strict 2PL

This is not serializable yet !!!

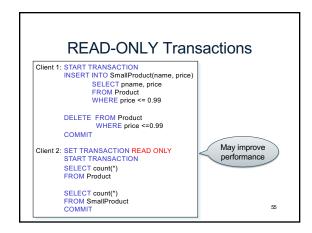

CSE 444 - Winter 2019

4. Isolation Level Serializable

- · "Long duration" WRITE locks
 - Strict 2PL
- "Long duration" READ locks
 - Strict 2PL
- · Predicate locking
 - To deal with phantoms

CSE 444 - Winter 2019

Commercial Systems

Always check documentation!

- DB2: Strict 2PL
- SQL Server:
 - Strict 2PL for standard 4 levels of isolation
 - Multiversion concurrency control for snapshot isolation
- PostgreSQL: Snapshot isolation; recently: seralizable Snapshot isolation (!)
- · Oracle: Snapshot isolation

CSE 444 - Winter 2018
