- **Database management systems.**  
Ramakrishnan and Gehrke.  
Third Ed. **Chapter 22.11**

March 10, 2021 CSE 444 - Winter 2020 3

3

## Outline

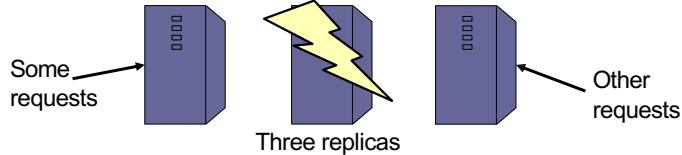

- Goals of replication
- Three types of replication
  - Synchronous (aka eager) replication
  - Asynchronous (aka lazy) replication
  - Two-tier replication

March 10, 2021 CSE 444 - Winter 2020 4

4

## Goals of Replication

- Goal 1: availability
- Goal 2: performance

Three replicas

- But, it's easy to build a replicated system that reduces performance and availability

March 10, 2021 CSE 444 - Winter 2020 5

5

## Types of Replication

	Master	Group
Synchronous	✓	
Asynchronous		

March 10, 2021

CSE 444 - Winter 2021

6

6

## Synchronous Replication

- Also called **eager replication**
- All updates are applied to all replicas (or to a majority) as part of a single transaction (need two phase commit)
- Main goal: as if there was only one copy
  - Maintain **consistency**
  - Maintain **one-copy serializability**
  - I.e., execution of transactions has same effect as an execution on a non-replicated db
- Transactions must acquire **global locks**

March 10, 2021

CSE 444 - Winter 2020

7

7

## Synchronous Replication

March 10, 2021

CSE 444 - Winter 2020

8

8

## Synchronous Master Replication

- **One master for each object holds primary copy**
  - The "Master" is also called "Primary"
  - To update object, transaction must acquire a lock at the master
  - Lock at the master is global lock
- Master propagates updates to replicas synchronously
  - Updates propagate as part of the same distributed transaction
    - Need to run 2PC at the end
  - For example, using triggers

March 10, 2021

CSE 444 - Winter 2020

9

9

## Crash Failures

- **What happens when a secondary crashes?**
  - Nothing happens
  - When secondary recovers, it catches up
- **What happens when the master/primary fails?**
  - Blocking would hurt availability
  - Must choose a new primary: run election

March 10, 2021

CSE 444 - Winter 2020

10

10

## Network Failures

- **Network failures can cause trouble...**
  - Secondaries think that primary failed
  - Secondaries elect a new primary
  - But primary can still be running
  - Now have two primaries!

March 10, 2021

CSE 444 - Winter 2020

11

11

## Majority Consensus

- **To avoid problem, only majority partition can continue processing at any time**
- **In general,**
  - Whenever a replica fails or recovers...
  - a set of communicating replicas must determine...
  - whether they have a majority before they can continue

March 10, 2021

CSE 444 - Winter 2020

12

12

## Types of Replication

	Master	Group
Synchronous	✓	✓
Asynchronous		

March 10, 2021

CSE 444 - Winter 2020

13

13

## Synchronous Group Replication

### ▪ Master-less

- Any node can initiate a transaction!
- Need to gather a number of nodes that agree on a particular transaction

March 10, 2021

14

14

## Synchronous Group Replication

### ▪ With $n$ copies

- Exclusive lock on  $x$  copies is global exclusive lock
- Shared lock on  $s$  copies is global shared lock
- Must have:  $2x > n$  and  $s + x > n$
- Version numbers serve to identify current copy

March 10, 2021

15

15

## Synchronous Group Replication

### ▪ Majority locking

- $s = x = \lceil (n+1)/2 \rceil$  eg: 11 nodes: need 6 locked
- No need to run any reconfiguration algorithms

### ▪ Read-locks-one, write-locks-all

- $s=1$  and  $x = n$ , high read performance
- Need to make sure algo runs on quorum of computers

March 10, 2021

CSE 444 - Winter 2020

16

16

## Synchronous Replication Properties

### ▪ Favours consistency over availability

- Only majority partition can process requests
- There appears to be a single copy of the db

### ▪ High runtime overhead

- Must lock and update at least majority of replicas
- Two-phase commit
- Runs at pace of slowest replica in quorum
- So overall system is now slower
- Higher deadlock rate (transactions take longer)

March 10, 2021

CSE 444 - Winter 2020

17

17

## Types of Replication

	Master	Group
Synchronous	✓	✓
Asynchronous	✓	

March 10, 2021

CSE 444 - Winter 2020

18

18

## Asynchronous Replication

- Also called **lazy replication**
- Also called **optimistic replication**
- Main goals: availability and performance
- Approach
  - One replica updated by original transaction
  - Updates propagate asynchronously to other replicas

March 10, 2021

CSE 444 - Winter 2020

19

19

## Asynchronous Replication

March 10, 2021

CSE 444 - Winter 2020

20

20

## Asynchronous Master Replication

- **One master holds primary copy**
  - Transactions update primary copy
  - Master asynchronously propagates updates to replicas, which process them in same order (e.g. through log shipping)
  - Ensures single-copy serializability
- **What happens when master/primary fails?**
  - Can lose most recent transactions when primary fails!
  - After electing a new primary, secondaries must agree who is most up-to-date

March 10, 2021

CSE 444 - Winter 2020

21

21

## Types of Replication

	Master	Group
Synchronous	✓	✓
Asynchronous	✓	✓

March 10, 2021

CSE 444 - Winter 2020

22

22

## Asynchronous Group Replication

- Also called **multi-master**
- Best scheme for availability
- **Cannot guarantee one-copy serializability!**

March 10, 2021

CSE 444 - Winter 2020

23

23

## Asynchronous Group Replication

- **Cannot guarantee one-copy serializability!**
- **Instead guarantee convergence**
  - Db state does not reflect any serial execution
  - But all replicas have the same state
- **Detect conflicts and reconcile replica states**
- Different reconciliation techniques are possible
  - Manual
  - Most recent timestamp wins
  - Site A wins over site B
  - User-defined rules, etc.

March 10, 2021

CSE 444 - Winter 2020

24

24

## Detecting Conflicts Using Timestamps

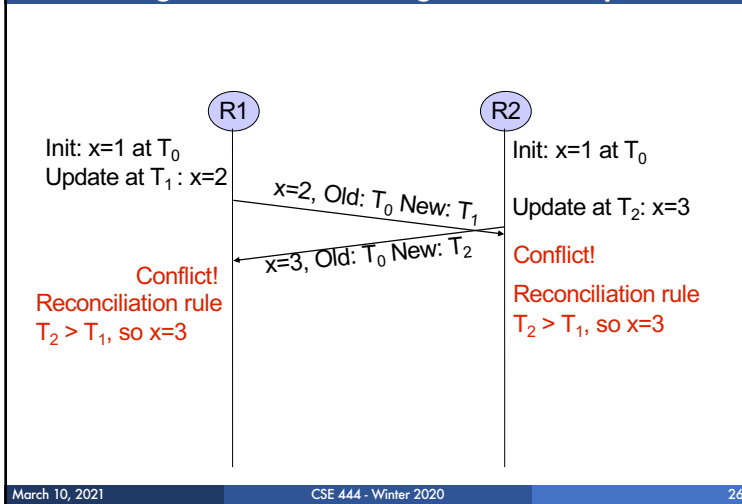

March 10, 2021

CSE 444 - Winter 2020

25

25

## Detecting Conflicts Using Timestamps

26

## Vector Clocks

- An extension of Multiversion Concurrency Control (MVCC) to multiple servers
- Standard MVCC:  
each data item  $X$  has a timestamp  $t$ :  
 $X_4, X_9, X_{10}, X_{14}, \dots, X_t$
- Vector Clocks:  
 $X$  has set of [server, timestamp] pairs  
 $X([s_1, t_1], [s_2, t_2], \dots)$

March 10, 2021

CSE 444 - Winter 2020

27

27

## Asynchronous Group Replication Properties

- Favours **availability** over consistency
  - Can read and update any replica
  - High runtime performance
- **Weak consistency**
  - Conflicts and reconciliation

March 10, 2021

CSE 444 - Winter 2020

38

38

## Outline

- Goals of replication
- Three types of replication
  - Synchronous (aka eager) replication
  - Asynchronous (aka lazy) replication
  - Two-tier replication

March 10, 2021

CSE 444 - Winter 2020

39

39

## Two-Tier Replication

- Benefits of lazy master and lazy group
- Each object has a master with primary copy
- When disconnected from master
  - Secondary can only run **tentative transactions**
- When reconnects to master
  - Master reprocesses all tentative transactions
  - Checks an acceptance criterion
  - If passes, we now have **final commit order**
  - Secondary **undoes tentative and redoes committed**

March 10, 2021

CSE 444 - Winter 2020

40

40

## Conclusion

- Replication is a very important problem
  - Fault-tolerance (various forms of replication)
  - Caching (lazy master)
  - Warehousing (lazy master)
  - Mobility (two-tier techniques)
- Replication is complex, but basic techniques and trade-offs are **very well known**
  - Synchronous or asynchronous replication
  - Master or quorum

## Some Popular NewSQL Systems

- H-Store
  - Research system from Brown U., MIT, CMU, and Yale
  - Commercialized as VoltDB
- Hekaton
  - Microsoft
  - Fully integrated into SQL Server
- Hyper
  - Hybrid OLTP/OLAP
  - Research system from TU Munich. Bought by Tableau
- Spanner
  - Google

March 10, 2021

43

43

## H-Store Insight

TRADITIONAL DBMS:

OLTP THROUGH THE LOOKING GLASS,  
AND WHAT WE FOUND THERE  
*SIGMOD*, pp. 981-992, 2008.

Slide from Andy Pavlo @ CMU

March 10, 2021

CSE 444 - Winter 2020

44

## H-Store Key Ideas

- **Main-memory storage**
  - Avoids disk IO costs / buffer pool costs
  - Durability through snapshots + cmd log
  - Replication
- **Serial execution**
  - One database partition per thread on one core
  - Avoid overheads related to locking
- **All transactions are stored procedures**
  - Command logging avoids heavy recovery overheads
- **Avoid distributed transactions**
  - But when needed, run 2PC

March 10, 2021

CSE 444 - Winter 2020

45

## STORED PROCEDURE

VoteCount:

```
SELECT COUNT(*)
FROM votes
WHERE phone_num = ?;
```

InsertVote:

```
INSERT INTO votes
VALUES (?, ?, ?);
```

```
run(phoneNum, contestantId, currentTime) {
  result = execute(VoteCount, phoneNum);
  if (result > MAX_VOTES) {
    return (ERROR);
  }
  execute(InsertVote, phoneNum,
    contestantId,
    currentTime);
  return (SUCCESS);
}
```

Slide from Andy Pavlo @ CMU

46

## Voter Benchmark

Japanese "American Idol"

March 10, 2021

CSE 444 - Winter 2020

Slide from Andy Pavlo @ CMU

47

## Hekaton

- Focus: DBMS with large main memories and many core CPUs
- Integrated with SQL Server
- Key user-visible features
  - Simply declare a table "memory resident"
  - Hekaton tables are fully durable and transactional, though non-durable tables are also supported
  - Query can touch both Hekaton and regular tables

March 10, 2021

CSE 444 - Winter 2020

48

48

## Hekaton Key Details

- Idea: To increase transaction throughput must decrease number of instructions / transaction
- Main-memory DBMS
  - Optimize indexes for memory-resident data
  - Durability by logging and checkpointing records to external storage
- No partitioning
  - Any thread can touch any row of any table
- No locking
  - Uses a new MVCC method for isolation

March 10, 2021

CSE 444 - Winter 2020

49

49

## Hekaton More Details

- Optimized stored procedures
  - Compile statements and stored procedures into customized, highly efficient machine code

March 10, 2021

CSE 444 - Winter 2020

50

50

## Hyper

- Hybrid OLTP and OLAP
- In-memory data management
  - Including optimized indexes for memory-resident data
  - Data compression for cold data
- Data-centric code generation
  - SQL translated to LLVM
- OLAP separated from OLTP using MVCC
- Exploits hardware transactional memory
- Data shuffling and distribution optimizations

March 10, 2021

CSE 444 - Winter 2020

51

51

## Conclusion

- Many innovations recently in
  - Big data analytics
  - Transaction processing at very large scale
- Many more problems remain open
- This course teaches foundations
- Innovate with an open mind!
