# Merge-Sort: Basic Terminology

- A **run** in a sequence is an increasing subsequence
- What are the runs?

2, 4, 99, 103, 88, 77, 3, 79, 100, 2, 50

# External Merge-Sort: Step 1

**Phase one:** load  $M$  blocks in memory, sort, send to disk, repeat

# External Merge-Sort: Step 1

**Phase one:** load  $M$  blocks in memory, sort, send to disk, repeat

Q: How long are the runs?

# External Merge-Sort: Step 1

**Phase one:** load  $M$  blocks in memory, sort, send to disk, repeat

Phase two: merge  $M$  runs into a bigger run

- Merge  $M - 1$  runs into a new run
- Result: runs of length  $M (M - 1) \approx M^2$

# Example

- Merging three runs to produce a longer run:

**0, 14, 33, 88, 92, 192, 322**

**2, 4, 7, 43, 78, 103, 523**

Output:

**0**

# External Merge-Sort: Step 2

Phase two: merge  $M$  runs into a bigger run

- Merge  $M - 1$  runs into a new run
- Result: runs of length  $M(M - 1) \approx M^2$

If approx.  $B \leq M^2$  then we are done

# Cost of External Merge Sort

In theory:

- Number of I/O's:  $O(B(R) * \log_M B(R))$

In practice:

- Assumption  $B(R) \leq M^2$
- Read+write+read =  $3B(R)$

# Discussion

- What does  $B(R) \leq M^2$  mean?
- How large can  $R$  be?

# Discussion

- What does  $B(R) \leq M^2$  mean?
- How large can  $R$  be?
- Example:
  - Page size = 32KB
  - Memory size 32GB:  $M = 10^6$ -pages

# Discussion

- What does  $B(R) \leq M^2$  mean?
- How large can  $R$  be?
- Example:
  - Page size = 32KB
  - Memory size 32GB:  $M = 10^6$  pages
- $R$  can be as large as  $10^{12}$  pages
  - $32 \times 10^{15}$  Bytes = 32 PB

# Merge-Join

Join  $R \bowtie S$

- How?....

# Merge-Join

Join  $R \bowtie S$

- Step 1a: generate initial runs for R
- Step 1b: generate initial runs for S
- Step 2: merge and join
  - Either merge first and then join
  - Or merge & join at the same time
