Dear Colleague,

Account: yuliats@cs.washington.edu

Good news: Due to many requests, the submission deadline has been extended to 10 March 2022 (It is firm date).

We would like to invite you to submit a paper to 10. European Conference on Renewable Energy Systems (ECRES). **ECRES 2022 will be held hybrid mode, the participants can present their papers physically or online.** The event is going to be organized in Istanbul/Turkey under the technical sponsorship of Istanbul Medeniyet University and many international institutions. The conference is highly international with the participants from all continents and more than 40 countries.

The submission deadline and special and regular issue journals can be seen in ecres.net

There will be keynote speakers who will address specific topics of energy as you would see at ecres.net/keynotes.html

CLICK FOR PAPER SUBMISSION

All accepted papers will be published in a special Conference Proceedings under a specific ISBN. Besides, the extended versions will be delivered to reputable journals **indexed in SCI, E-SCI, SCOPUS, and EBSCO.** You can check our previous journal publications from ecres.net . **Please note that the official journal of the event, Journal of Energy Systems (dergipark.org.tr/jes) is also indexed in SCOPUS.**

Sentiment analysis

By **John Neal**
This review is from: Accoutrements Horse Head Mask (Toy)
When I turned State's Witness, they didn't have enough money to put me in the Witness Protection Program, so they bought me this mask and gave me a list of suggested places to move. Since then I've lived my life in peace and safety knowing that my old identity is forever obscured by this life-saving item.

By **Christine E. Torok**
Verified Purchase (What's this?)
First of all, for taste I would rate these a 5. So good. Soft, true-to-taste fruit flavors like the sugar variety...I was a happy camper.

BUT (or should I say BUTT), not long after eating about 20 of these all hell broke loose. I had a gastrointestinal experience like nothing I've ever imagined. Cramps, sweating, bloating beyond my worst nightmare. I've had food poisoning from some bad shellfish and that was almost like a skip in the park compared to what was going on inside

By 1925 Vietnam was divided into three parts under French colonial rule. The southern region embracing Saigon and the Mekong delta was the colony Cochin-China; the central area with its imperial capital at Hue was the protectorate of Annam.

Clara never failed to be astonished by the extraordinary felicity of her own name. She found it hard to trust herself to the mercy of fate, which had managed over the years to convert her greatest shame into one of the greatest assets...

Labels y: mon, srp, srp, bul

Predictions $\hat{y}$: mon, rus, bul, bul

Goal: create a function f that makes a prediction $\hat{y}$ given an input x

Over the next couple of days, we'll investigate:

1. How do we "digest" text into a form usable by a function?

   (Keywords for this section: features, feature extraction,

   feature selection, representations)

2. What kinds of strategies might we use to create our function *f?*

   (Keyword for this section: models)

3. How do we evaluate our function *f?*

   (Keyword for this section: … evaluation)

How do we "digest" text into a form usable by a function?

Classification: features (measurements)

- Perform measurements and obtain features

4.2,   212,   3.4,   1332

↓   ↓   ↓   ↓

diameter, weight, softness, color

5.2,   315,   5.7,   4567

↓   ↓   ↓   ↓

diameter, weight, softness, color

Text classification – feature extraction

What can we measure over text? Consider this movie review:

I love this movie! It's sweet, but with satirical humor. The dialogue is great, and the adventure scenes are fun… It manages to be whimsical and romantic while laughing at the conventions of the fairy tale genre. I would recommend it just to about anyone. I've seen it several times, and I'm always happy to see it again whenever I have a friend who hasn't seen it before.

Types of textual features

- Words
    - content words, stop-words
    - punctuation? tokenization? lemmatization? lowercase?
- Word sequences
    - bigrams, trigrams, n-grams
- Grammatical structure, sentence parse tree
- Words' part-of-speech
- Word vectors
- …

Possible representations for text

- Bag-of-Words (BOW)
  - Easy, no effort required
  - Variable size, ignores sentential structure

- Hand-crafted features
  - Full control, can use NLP pipeline, class-specific features
  - Over-specific, incomplete, makes use of NLP pipeline

- Learned feature representations
  - Can learn to contain all relevant information
  - Needs to be learned

Bag-of-Words (BOW)

- Given a document d (e.g., a movie review) – how to represent d ?

I love this movie! It's sweet, but with satirical humor. The dialogue is great and the adventure scenes are fun... It manages to be whimsical and romantic while laughing at the conventions of the fairy tale genre. I would recommend it to just about anyone. I've seen it several times, and I'm always happy to see it again whenever I have a friend who hasn't seen it yet!

- Generative models
- Discriminative models
- Naïve Bayes
- Linear models
  - Multinomial logistic regression
  (aka MaxEnt)
- Non-linear models
  - Multilayer perceptron
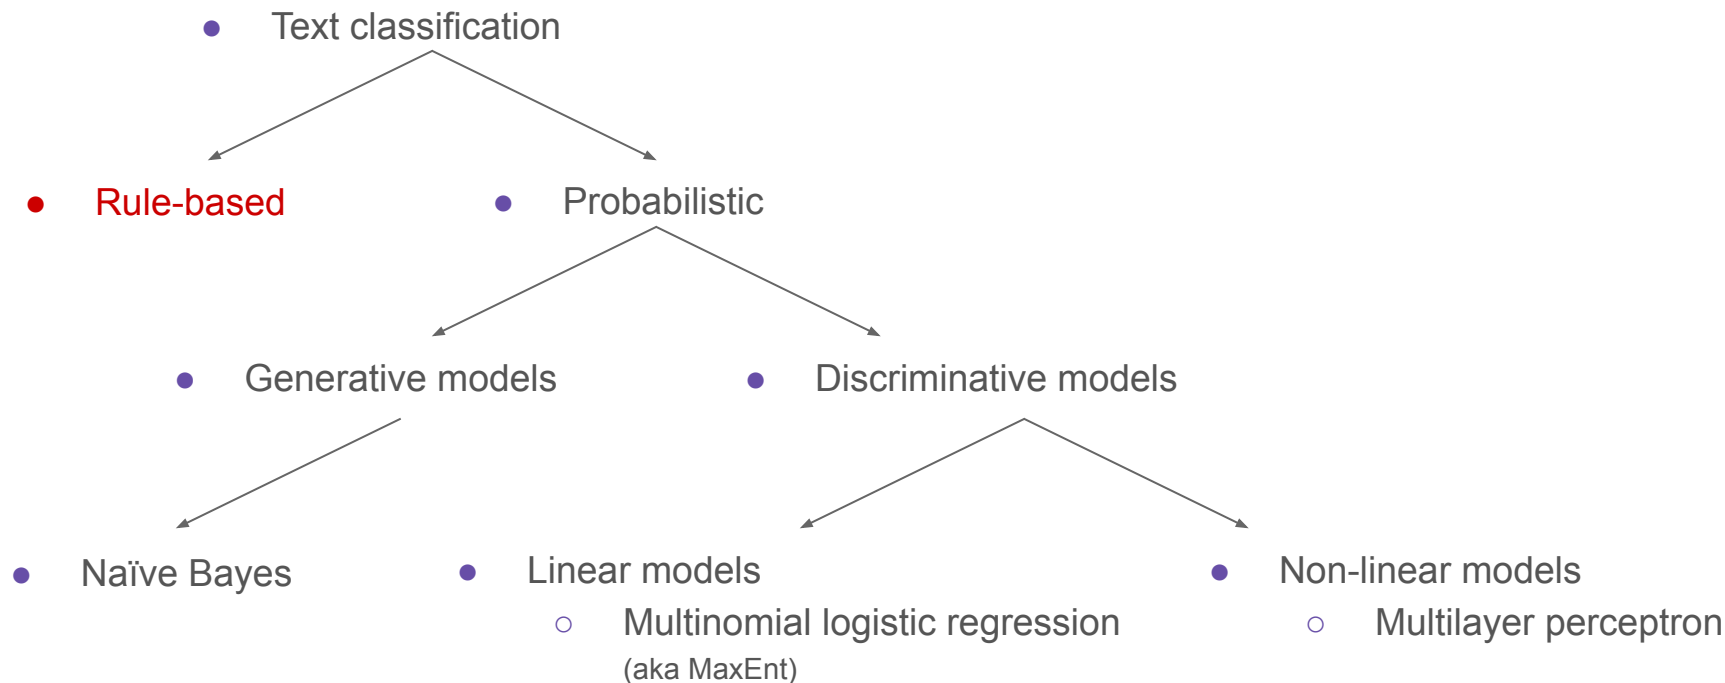

Rule-based classifier

```python
def classify_sentiment(document):
    for word in document:
        if word in {"good", "wonderful", "excellent"}:
            return 5
        if word in {"bad", "awful", "terrible"}:
            return 1
```

Rule-based classification: challenges

Sentiment: Half submarine flick, half ghost story, all in one a criminally neglected film.

Rule-based classification: challenges

Sentiment: Half submarine flick, half ghost story, all in one a criminally neglected film.

⟶ hard to identify a priori which words are informative (and what information they carry!)

Rule-based classification: challenges

Sentiment: Half submarine flick, half ghost story, all in one a criminally neglected film.

⟶ hard to identify a priori which words are informative (and what information they carry!)

Sentiment: It's not life-affirming, it's vulgar, it's mean, but I liked it.

Rule-based classification: challenges

Sentiment: Half submarine flick, half ghost story, all in one a criminally neglected film.

⟶ hard to identify a priori which words are informative (and what information they carry!)

Sentiment: It's not life-affirming, it's vulgar, it's mean, but I liked it.

⟶word order matters, but hard to encode in rules!

Rule-based classification: challenges

Sentiment: Half submarine flick, half ghost story, all in one a criminally neglected film.

⟶ hard to identify a priori which words are informative (and what information they carry!)

Sentiment: It's not life-affirming, it's vulgar, it's mean, but I liked it.

⟶word order matters, but hard to encode in rules!

Language ID: All falter, stricken in kind.   "LINGERIE SALE"

⟶simple features can be misleading!

Rule-based classification

But don't forget: if you don't have access to data, speaker intuition and a bit of coding get you pretty far!

We'll consider alternative models for classification

- Text classification

- Rule-based   ● **Probabilistic**

- Generative models   ● Discriminative models

- Naïve Bayes   ● Linear models   ● Non-linear models
  - Multinomial logistic regression
  (aka MaxEnt)   - Multilayer perceptron
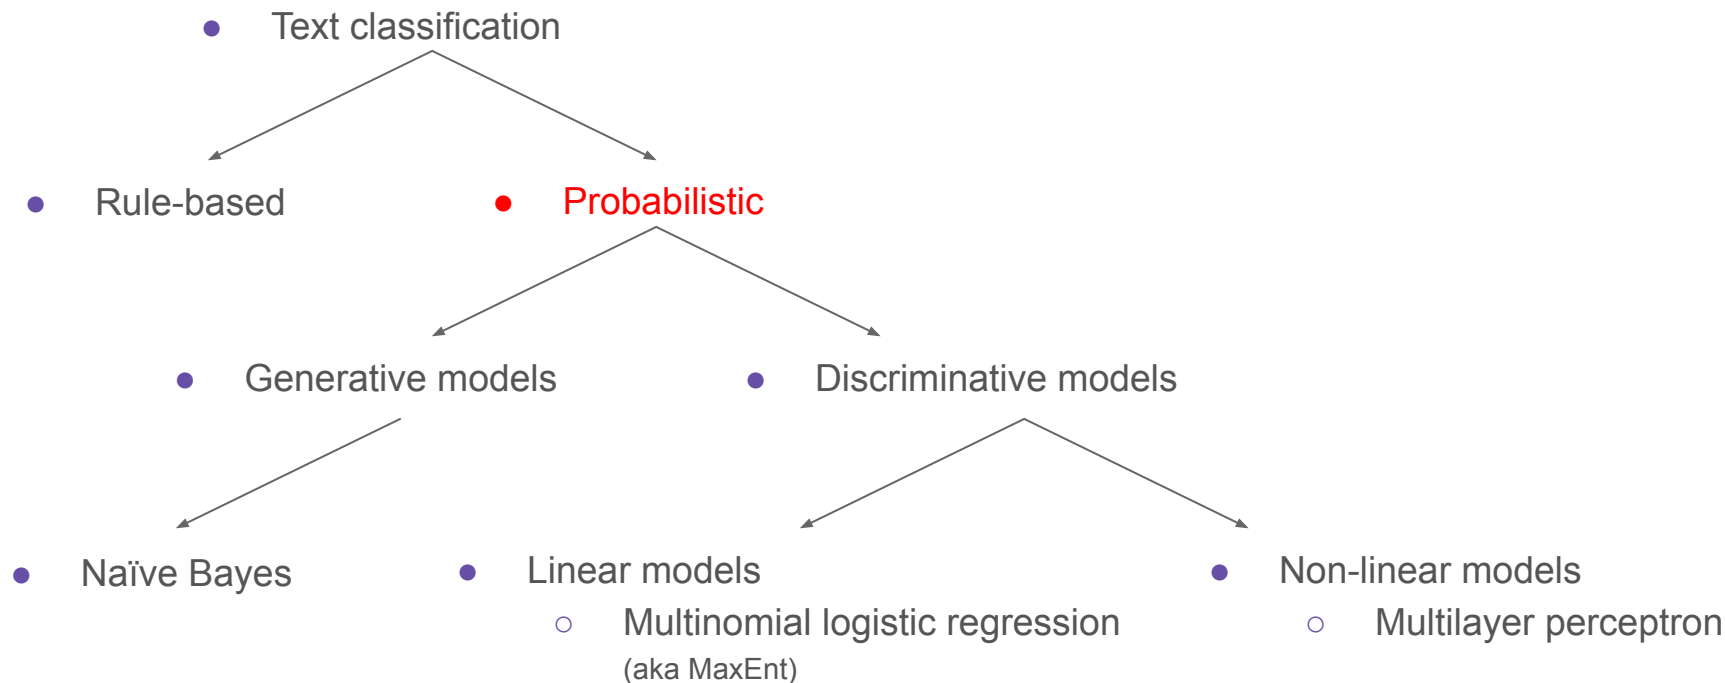

Learning-based classification
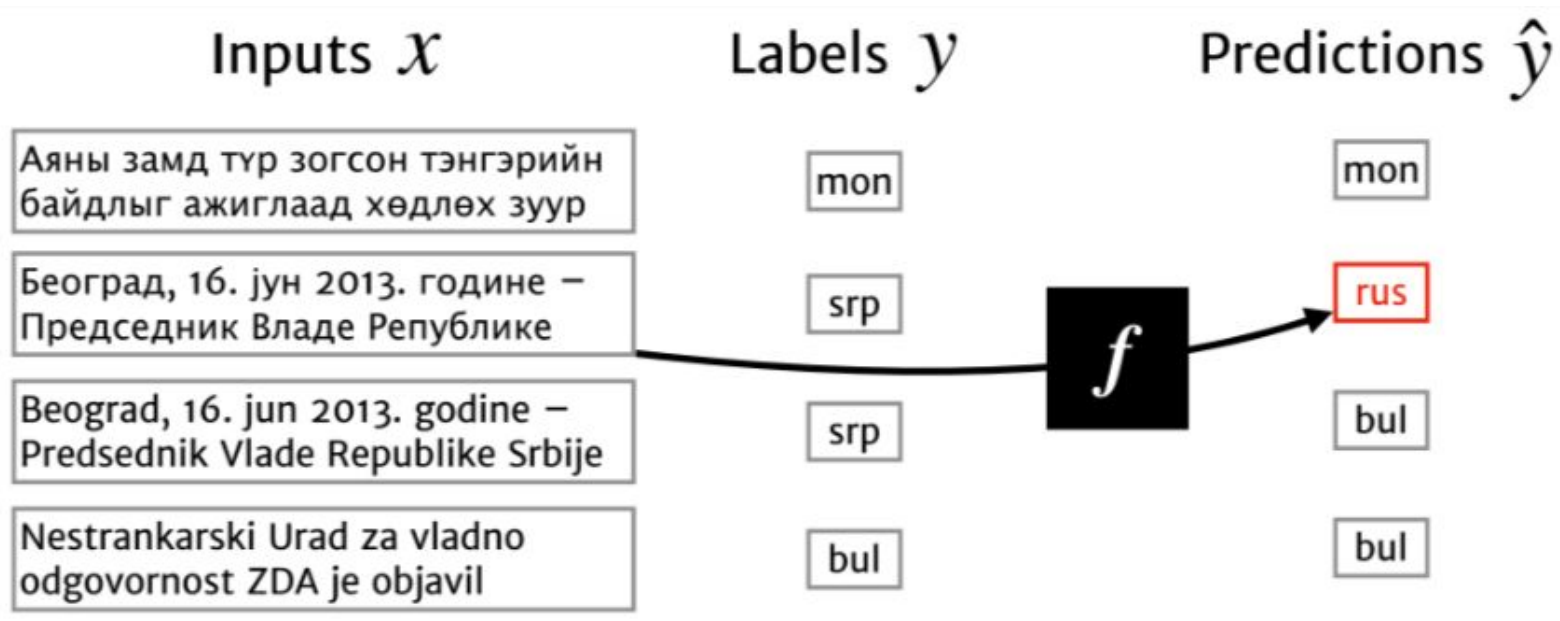

pick the function *f* that does "best" on training data

Goal: ~~create a function *f* that makes a prediction *ŷ* given an input *x*~~

Classification: learning from data

- Supervised
  - labeled examples
    - Binary (true, false)
    - Multi-class classification (politics, sports, gossip)
    - Multi-label classification (#party #FRIDAY #fail)
- Unsupervised
  - no labeled examples
- Semi-supervised
  - labeled examples + non-labeled examples
- Weakly supervised
  - heuristically-labeled examples

Where do datasets come from?

Human institutions	Noisy labels	Expert annotation	Crowd workers
Government proceedings	Domain names	Treebanks	Question answering
Product reviews	Link text	Biomedical corpora	Image captions

Supervised classification

training

inference
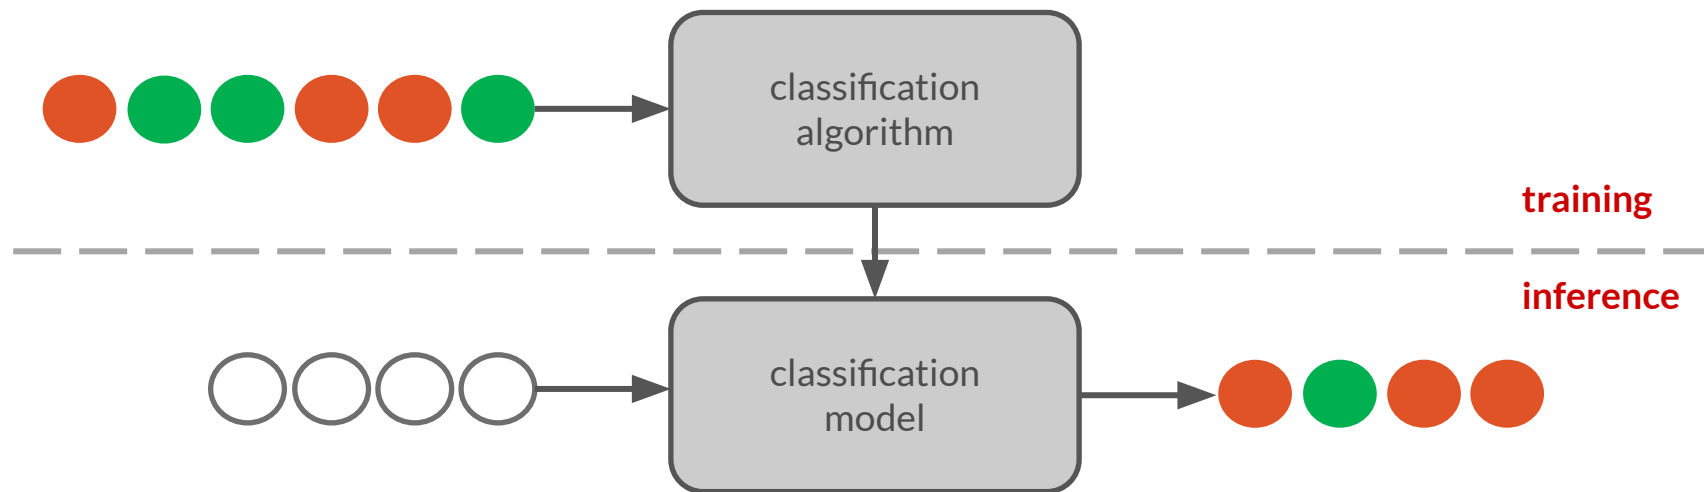

Training, validation, and test sets
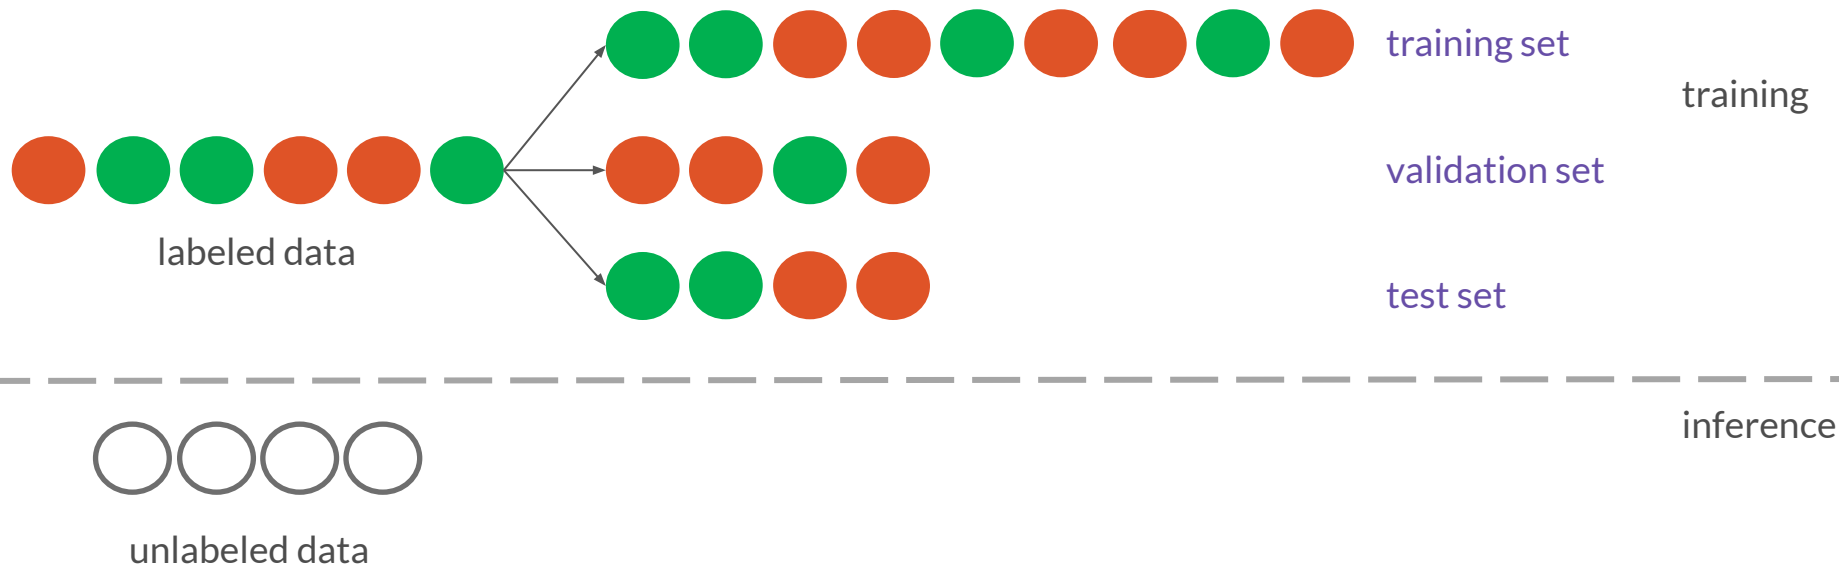

training set

training

validation set

test set

labeled data

inference

unlabeled data

Supervised classification: formal setting

- Learn a **classification model** from labeled data on

  - properties ("**features**") and their importance ("**weights**")

- X: set of attributes or features $\{x_1, x_2, \ldots, x_n\}$

  - e.g. fruit measurements, or word counts extracted from an input documents

- y: a "class" label from the label set $Y = \{y_1, y_2, \ldots, y_k\}$

  - e.g., fruit type, or spam/not spam, positive/negative/neutral

Supervised classification: formal setting

- Learn a **classification model** from labeled data on

  - properties ("features") and their importance ("weights")

- X: set of attributes or features $\{x_1, x_2, \ldots, x_n\}$

  - e.g. fruit measurements, or word counts extracted from an input documents

- y: a "class" label from the label set $Y = \{y_1, y_2, \ldots, y_k\}$

  - e.g., fruit type, or spam/not spam, positive/negative/neutral

- Given data samples $\{x_1, x_2, \ldots, x_n\}$ and corresponding labels $Y = \{y_1, y_2, \ldots, y_k\}$

- We **train** a function $f: x \in X \to y \in Y$ (the model)

Supervised classification: formal setting

- Learn a **classification model** from labeled data on

  - properties ("features") and their importance ("weights")

- X: set of attributes or features $\{x_1, x_2, \ldots, x_n\}$

  - e.g. fruit measurements, or word counts extracted from an input documents

- y: a "class" label from the label set $Y = \{y_1, y_2, \ldots, y_k\}$

  - e.g., fruit type, or spam/not spam, positive/negative/neutral

- At inference time, apply the model on new instances to **predict the label**

We'll consider alternative models for classification

- Supervised text classification

- Rule-based
- Probabilistic

- Generative models
- Discriminative models

- Naïve Bayes
- Linear models
  - Multinomial logistic regression
  (aka MaxEnt)
- Non-linear models
  - Multilayer perceptron

Generative and discriminative models

- **Generative model:** a model that calculates the probability of the input data itself

$$P(X, Y)$$

joint

- **Discriminative model:** a model that calculates the probability of a latent trait given the data

$$P(Y \mid X)$$

conditional

Generative and discriminative models

- Generative text classification: Learn a model of the joint $P(X, y)$, and find

$$\hat{y} = \underset{\tilde{y}}{\mathrm{argmax}} \; P(X, \tilde{y})$$

- Discriminative text classification: Learn a model of the conditional $P(y \mid X)$, and find

$$\hat{y} = \underset{\tilde{y}}{\mathrm{argmax}} \; P(\tilde{y}|X)$$

We'll consider alternative models for classification

- Supervised text classification

- Rule-based
- Probabilistic

- Generative models
- Discriminative models

- Naïve Bayes
- Linear models
  - Multinomial logistic regression
  (aka MaxEnt)
- Non-linear models
  - Multilayer perceptron
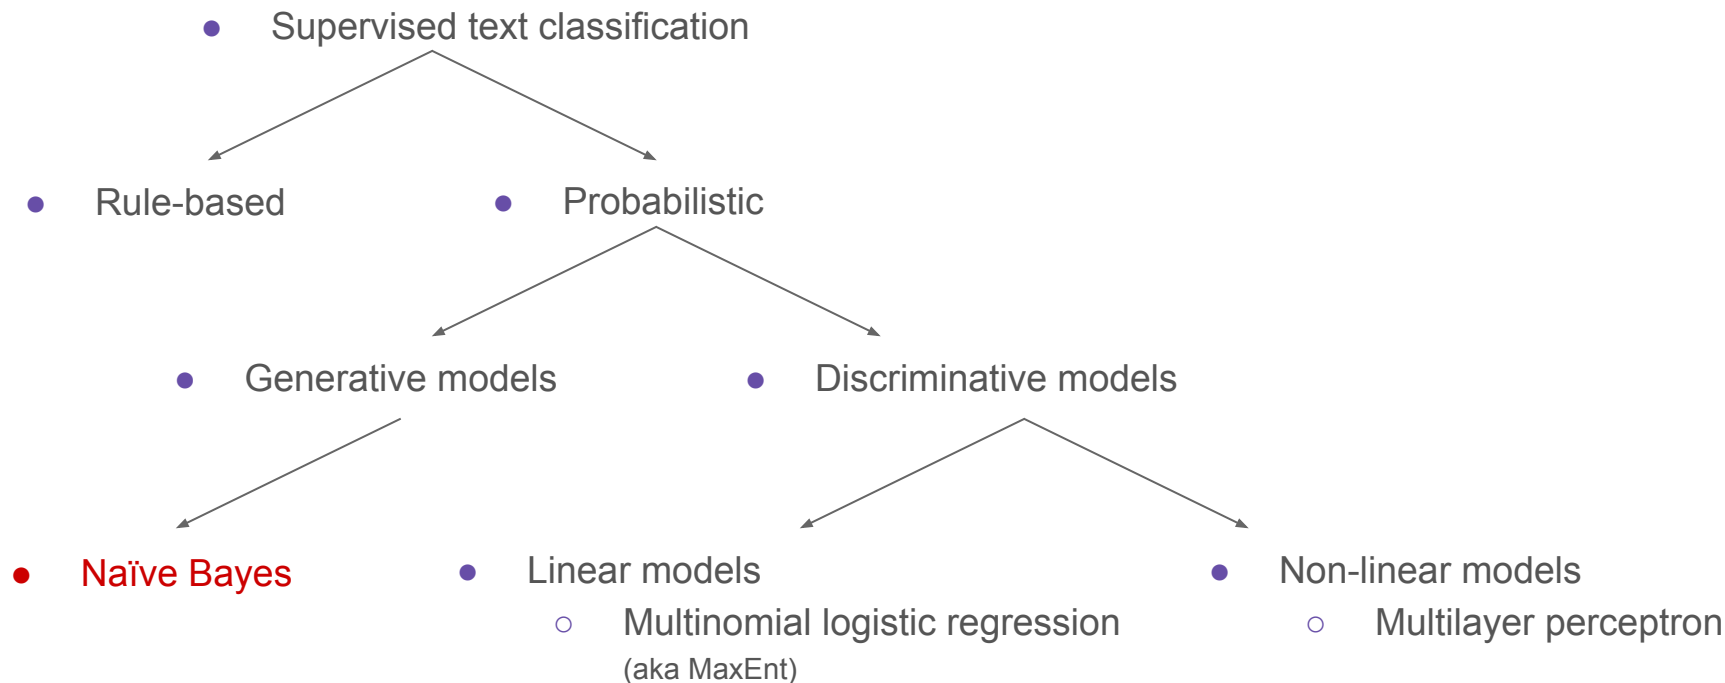

Generative text classification: naïve Bayes

- Simple (naïve) classification method
  - based on the Bayes rule
- Relies on very simple representation of a documents
  - bag-of-words, no relative order
- A good baseline for more sophisticated models

Andrew Y. Ng and Michael I. Jordan, On discriminative vs. generative classifiers: A comparison of logistic regression and naive Bayes, Advances in Neural Information Processing Systems 14 (NIPS), 2001.

Naïve Bayes

Sentiment analysis: movie reviews

- Given a document d (e.g., a movie review)

- Decide which class c it belongs to: positive, negative, neutral

- Compute $P(c \mid d)$ for each c

  - $P(\text{positive} \mid d), P(\text{negative} \mid d), P(\text{neutral} \mid d)$

  - select the one with max P

Bag-of-Words (BOW) (I told you it'd be back soon!)

- Given a document d (e.g., a movie review) – how to represent d ?

I love this movie! It's sweet, but with satirical humor. The dialogue is great and the adventure scenes are fun... It manages to be whimsical and romantic while laughing at the conventions of the fairy tale genre. I would recommend it to just about anyone. I've seen it several times, and I'm always happy to see it again whenever I have a friend who hasn't seen it yet!

Figure 7.1 Intuition of the multinomial naive Bayes classifier applied to a movie review. The position of the words is ignored (the *bag of words* assumption) and we make use of the frequency of each word.

Figure from J&M 3rd ed. draft, sec 7.1

Naïve Bayes

- Given a document d and a class c, Bayes' rule:

$$P(c|d) = \frac{P(d|c)P(c)}{P(d)}$$

Naïve Bayes

- Given a document d and a class c, Bayes' rule:

$$P(c|d) = \frac{P(d|c)P(c)}{P(d)}$$

$$P(\text{'positive'}|d) \propto P(d|\text{'positive'})P(\text{'positive'})$$

likelihood   prior

Naïve Bayes

- Given a document d and a class c, Bayes' rule:

$$P(c|d) = \frac{P(d|c)P(c)}{P(d)}$$

$$P(\text{`positive'}|d) \propto P(d|\text{`positive'})P(\text{`positive'})$$

prior

neutral

negative

positive

Naïve Bayes

- Given a document d and a class c, Bayes' rule:

$$P(c|d) = \frac{P(d|c)P(c)}{P(d)}$$

$$P(\text{'positive'}|d) \propto P(d|\text{'positive'})P(\text{'positive'})$$

likelihood

Naïve Bayes independence assumptions

$$P(w_1, w_2, \ldots, w_n | c)$$

- **Bag of Words assumption**: Assume position doesn't matter
- **Conditional Independence**: Assume the feature probabilities $P(w_i | c_j)$ are independent given the class c

$$P(w_1, w_2, \ldots, w_n | c) = P(w_1 | c) \times P(w_2 | c) \times P(w_3 | c) \times \ldots \times P(w_n | c)$$

Document representation

I love this movie. It's sweet but with satirical humor. The dialogue is great and the adventure scenes are fun… it manages to be whimsical and romantic while laughing at the conventions of the fairy tale genre. I would recommend it to just about anyone. I've seen it several times, and I'm always happy to see it again whenever I have a friend who hasn't seen it yet!

Generative text classification: Naïve Bayes

$$\mathrm{C}_{NB} = \operatorname*{argmax}_{c} P(c|d) = \operatorname*{argmax}_{c} \frac{P(d|c)P(c)}{P(d)} \propto$$ Bayes rule

$$\operatorname*{argmax}_{c} P(d|c)P(c) =$$ same denominator

$$\operatorname*{argmax}_{c} P(w_1, w_2, \ldots, w_n|c)P(c) =$$ representation

$$\operatorname*{argmax}_{c_j} P(c_j) \prod_i P(w_i|c)$$ conditional independence

Underflow prevention: log space

- Multiplying lots of probabilities can result in floating-point underflow
- Since log(xy) = log(x) + log(y)
  - better to sum logs of probabilities instead of multiplying probabilities
- Class with highest un-normalized log probability score is still most probable

$$C_{NB} = \underset{c_j}{\mathrm{argmax}} \; P(c_j) \prod_i P(w_i|c)$$

$$C_{NB} = \underset{c_j}{\mathrm{argmax}} \; log(P(c_j)) + \sum_i log(P(w_i|c))$$

- Model is now just max of sum of weights

Learning the multinomial naïve Bayes

- How do we learn (train) the NB model?

Learning the multinomial naïve Bayes

- How do we learn (train) the NB model?
- We learn $P(c)$ and $P(w_i|c)$ from training (labeled) data

$$\mathrm{C}_{NB} = \underset{c_j}{\mathrm{argmax}}\ log(P(c_j)) + \sum_i log(P(w_i|c))$$

Parameter estimation

- Parameter estimation during training
- Concatenate all documents with category c into one mega-document
- Use the frequency of w_i in the mega-document to estimate the word probability

$$\mathrm{C}_{NB} = \underset{c_j}{\text{argmax}} \; log(P(c_j)) + \sum_i log(P(w_i|c))$$

$$\hat{P}(c_j) = \frac{doccount(C = c_j)}{N_{doc}}$$

$$\hat{P}(w_i|c_j) = \frac{count(w_i, c_j)}{\sum_{w \in V} count(w, c_j)}$$

Parameter estimation

$$\hat{P}(w_i|c_j) = \frac{count(w_i, c_j)}{\sum_{w \in V} count(w, c_j)}$$

- fraction of times word w_i appears among all words in documents of topic c_j

- Create mega-document for topic j by concatenating all docs in this topic
  - Use frequency of w in mega-document

Problem with Maximum Likelihood

- What if we have seen no training documents with the word "fantastic" and classified in the topic positive?

Problem with Maximum Likelihood

- What if we have seen no training documents with the word "fantastic" and classified in the topic positive?

$$\hat{P}(\text{``}fantastic\text{''}|c = \text{positive}) = \frac{count(\text{``}fantastic\text{''}, \text{positive})}{\sum_{w \in V} count(w, \text{positive})} = 0$$

- Zero probabilities cannot be conditioned away, no matter the other evidence!

$$\underset{c_j}{\text{argmax}} \ P(c_j) \prod_i P(w_i|c)$$

Laplace (add-1) smoothing for naïve Bayes

$$\hat{P}(w_i|c_j) = \frac{count(w_i, c_j) + 1}{\sum_{w \in V}(count(w, c_j) + 1)}$$

Laplace (add-1) smoothing for naïve Bayes

$$\hat{P}(w_i|c_j) = \frac{count(w_i, c_j) + 1}{\sum_{w \in V}(count(w, c_j) + 1)}$$

$$= \frac{count(w_i, c_j) + 1}{\left(\sum_{w \in V}(count(w, c_j))\right) + |V|}$$

Multinomial naïve Bayes : learning

- From training corpus, extract *Vocabulary*
- Calculate $P(c_j)$ terms
  - For each c_j do
    - $docs_j \leftarrow$ all docs with class $= c_j$
    - $P(c_j) \leftarrow \dfrac{|docs_j|}{total \ \# \ documents}$

Multinomial naïve Bayes : learning

- From training corpus, extract *Vocabulary*
- Calculate $P(c_j)$ terms
  - For each c_j do
    - $docs_j \leftarrow$ all docs with class $= c_j$
    - $P(c_j) \leftarrow \dfrac{|docs_j|}{total\ \#\ documents}$

- Calculate $P(w_i|\ c_j)$ terms
  - *Text$_j$* $\leftarrow$ single doc containing all docs$_j$
  - For each word w_i in *Vocabulary*
    - $n_i \leftarrow$ # of occurrences of w_i in *Text$_j$*
    - $P(w_j\ |\ c_j) \leftarrow \dfrac{n_i + \alpha}{n + \alpha |Vocabulary|}$

Example

	Doc	Words	Class
Training	1	Chinese Beijing Chinese	c
	2	Chinese Chinese Shanghai	c
	3	Chinese Macao	c
	4	Tokyo Japan Chinese	j
Test	5	Chinese Chinese Chinese Tokyo Japan	?

Example

	Doc	Words	Class
Training	1	Chinese Beijing Chinese	c
	2	Chinese Chinese Shanghai	c
	3	Chinese Macao	c
	4	Tokyo Japan Chinese	j
Test	5	Chinese Chinese Chinese Tokyo Japan	?

$$\hat{P}(c) = \frac{N_c}{N}$$

Priors:

$P(c) = \frac{3}{4}$

$P(j) = \frac{1}{4}$

Example

	Doc	Words	Class
Training	1	Chinese Beijing Chinese	c
	2	Chinese Chinese Shanghai	c
	3	Chinese Macao	c
	4	Tokyo Japan Chinese	j
Test	5	Chinese Chinese Chinese Tokyo Japan	?

$$\hat{P}(c) = \frac{N_c}{N}$$

$$\hat{P}(w \mid c) = \frac{count(w,c)+1}{count(c)+|V|}$$

Priors:

$P(c) =$ $\frac{3}{4}$

$P(j) =$ $\frac{1}{4}$

Conditional Probabilities:

$P(\text{Chinese}|c) =$ $(5+1) / (8+6) = 6/14 = 3/7$

$P(\text{Tokyo}|c) =$ $(0+1) / (8+6) = 1/14$

$P(\text{Japan}|c) =$ $(0+1) / (8+6) = 1/14$

$P(\text{Chinese}|j) =$ $(1+1) / (3+6) = 2/9$

$P(\text{Tokyo}|j) =$ $(1+1) / (3+6) = 2/9$

$P(\text{Japan}|j) =$ $(1+1) / (3+6) = 2/9$

Example

	Doc	Words	Class
Training	1	Chinese Beijing Chinese	c
	2	Chinese Chinese Shanghai	c
	3	Chinese Macao	c
	4	Tokyo Japan Chinese	j
Test	5	Chinese Chinese Chinese Tokyo Japan	?

$$\hat{P}(c) = \frac{N_c}{N} \qquad \hat{P}(w \mid c) = \frac{count(w,c)+1}{count(c)+|V|}$$

Priors:

$P(c) = \dfrac{3}{4}$

$P(j) = \dfrac{1}{4}$

Conditional Probabilities:

$P(\text{Chinese} \mid c) = (5+1) / (8+6) = 6/14 = 3/7$

$P(\text{Tokyo} \mid c) = (0+1) / (8+6) = 1/14$

$P(\text{Japan} \mid c) = (0+1) / (8+6) = 1/14$

$P(\text{Chinese} \mid j) = (1+1) / (3+6) = 2/9$

$P(\text{Tokyo} \mid j) = (1+1) / (3+6) = 2/9$

$P(\text{Japan} \mid j) = (1+1) / (3+6) = 2/9$

Choosing a class:

$P(c \mid d5) \propto 3/4 * (3/7)^3 * 1/14 * 1/14$
≈ 0.0003

$P(j \mid d5) \propto 1/4 * (2/9)^3 * 2/9 * 2/9$
≈ 0.0001

Summary: naïve Bayes is not so naïve

- Naïve Bayes is a probabilistic model
- Naïve because is assumes features are independent of each other for a class
- Very fast, low storage requirements
- Robust to Irrelevant Features
  - Irrelevant Features cancel each other without affecting results
- Very good in domains with many equally important features
  - Decision Trees suffer from fragmentation in such cases – especially if little data
- Optimal if the independence assumptions hold: If assumed independence is correct, then it is the Bayes Optimal Classifier for problem
- A good dependable baseline for text classification
  - But we will see other classifiers that give better accuracy

How do we evaluate our function f?

Classification evaluation

- Contingency table: model's predictions are compared to the correct results
  - a.k.a. confusion matrix

|	actual pos	actual neg
predicted pos	true positive (tp)	false positive (fp)
predicted neg	false negative (fn)	true negative (tn)
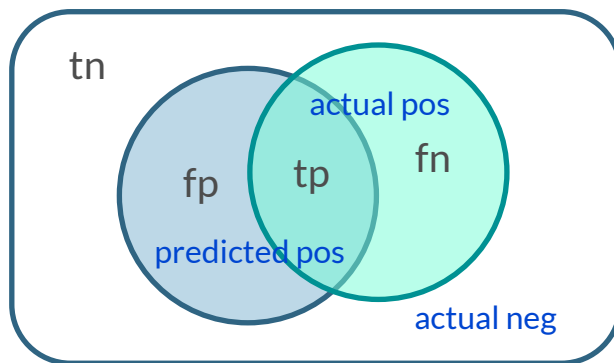

Classification evaluation

- Borrowing from Information Retrieval, empirical NLP systems are usually evaluated using the notions of precision and recall

Classification evaluation

- Precision (P) is the proportion of the selected items that the system got right in the case of text categorization
  - it is the % of documents classified as "positive" by the system which are indeed "positive" documents
- Reported per class or average

$$\text{precision} = \frac{true\ positives}{true\ positives + false\ positives} = \frac{tp}{tp + fp}$$
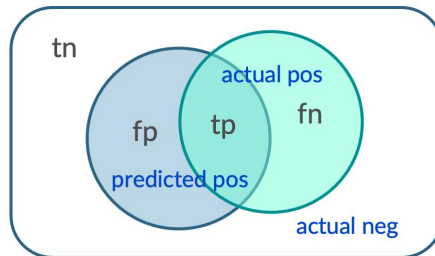

Classification evaluation

- **Recall (R)** is the proportion of actual items that the system selected in the case of text categorization
  - it is the % of the "positive" documents which were actually classified as "positive" by the system
- Reported per class or average

$$\text{recall} = \frac{\text{true positives}}{\text{true positives} + \text{false negatives}} = \frac{tp}{tp + fn}$$

tn

actual pos

fp   tp   fn

predicted pos

actual neg
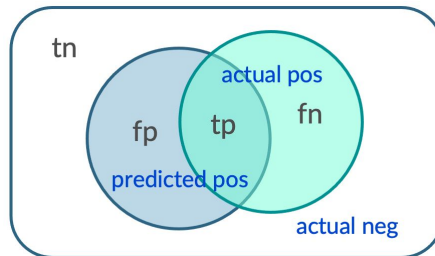

Classification evaluation

- We often want to trade-off precision and recall
  - typically: the higher the precision the lower the recall
  - can be plotted in a precision-recall curve
- It is convenient to combine P and R into a single measure
  - one possible way to do that is F measure

$$F_\beta = \frac{(\beta^2+1)PR}{\beta^2 P + R} \quad \text{for } \beta=1, \; F_1 = \frac{2PR}{P+R}$$

Classification evaluation

- Additional measures of performance: accuracy and error
  - accuracy is the proportion of items the system got right
  - error is its complement

$$\text{accuracy} = \frac{tp+tn}{tp+fp+tn+fn}$$

Micro- vs. macro-averaging

If we have more than one class, how do we combine multiple performance measures into one quantity?

- Macroaveraging
  - Compute performance for each class, then average.
- Microaveraging
  - Collect decisions for all classes, compute contingency table, evaluate.
Classification common practices

- Divide the training data into k folds (e.g., k=10)
- Repeat k times: train on k-1 folds and test on the holdout fold, cyclically
- Average over the k folds' results

K-fold cross-validation
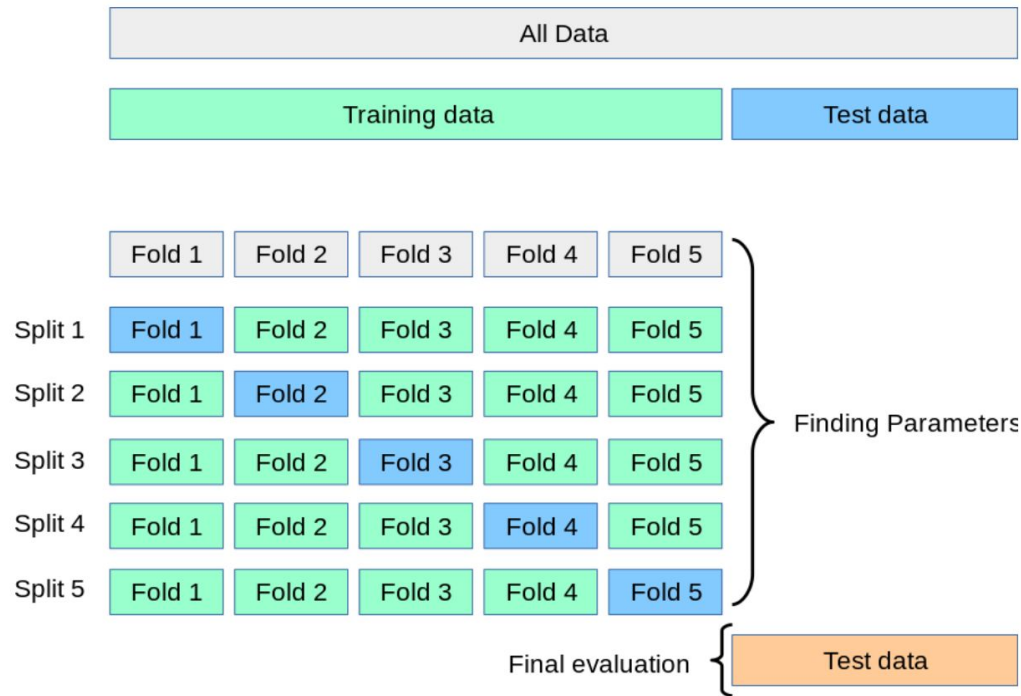

K-fold cross-validation

- **Metric: P/R/F1 or Accuracy**
- Unseen test set
  - avoid overfitting ('tuning to the test set')
  - more conservative estimate of performance
- Cross-validation over multiple splits
  - Handles sampling errors from different datasets
  - Pool results over each split
  - Compute pooled dev set performance

Next class

- Supervised text classification

- Rule-based
- Probabilistic

- Generative models
- Discriminative models

- Naïve Bayes
- Linear models
  - Multinomial logistic regression
  (aka MaxEnt)
- Non-linear models
  - Multilayer perceptron
