Motion Estimation

http://www.sandlotscience.com/Distortions/Breathing_objects.htm

http://www.sandlotscience.com/Ambiguous/barberpole.htm

Today's Readings

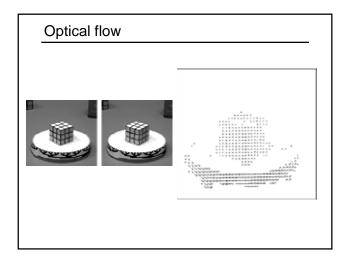

Trucco & Verri, 8.3 – 8.4 (skip 8.3.3, read only top half of p. 199)
 Numerical Recipes (Newton-Raphson), 9.4 (first four pages)

 http://www.ulib.org/webRoot/Books/Numerical_Recipes/bookcpdf/c9-4.pdf

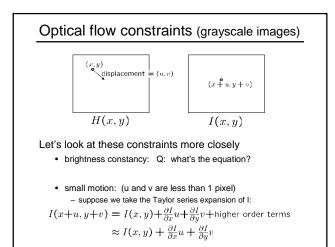

Why estimate motion?

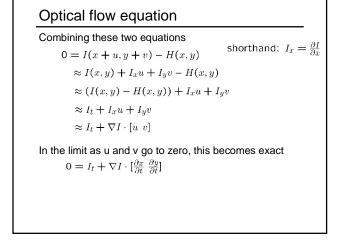

Lots of uses

- Track object behavior
- Correct for camera jitter (stabilization)
- Align images (mosaics)
- 3D shape reconstruction Special effects

Optical flow equation

 $0 = I_t + \nabla I \cdot [u \ v]$

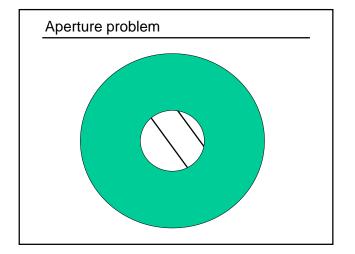

Q: how many unknowns and equations per pixel?

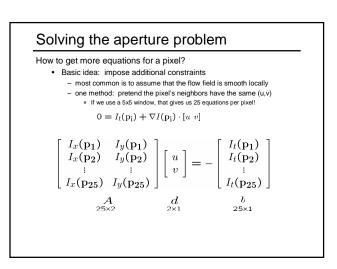

Intuitively, what does this constraint mean?

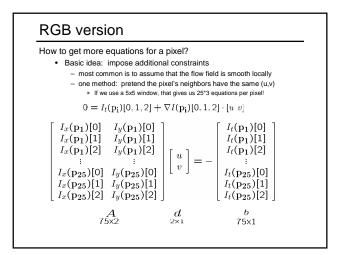

- · The component of the flow in the gradient direction is determined
- The component of the flow parallel to an edge is unknown

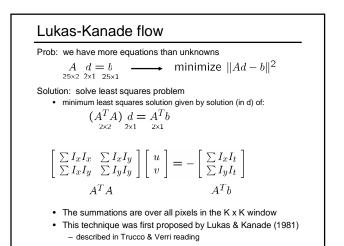

This explains the Barber Pole illusion http://www.sandlotscience.com/Ambiguous/barberpole.htm

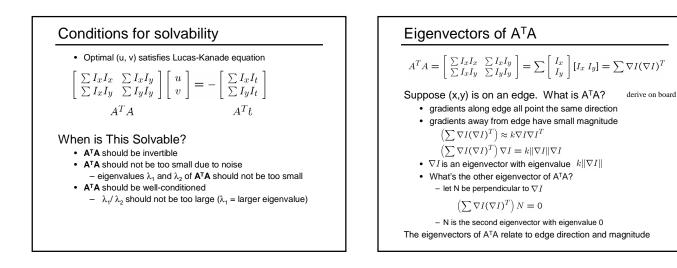

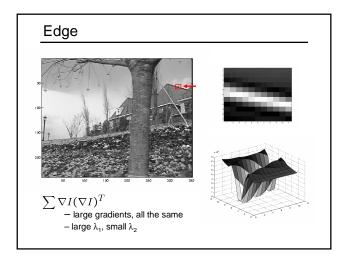

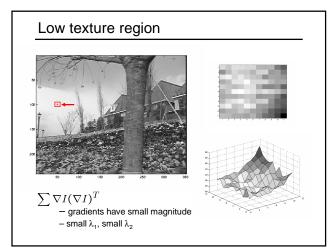

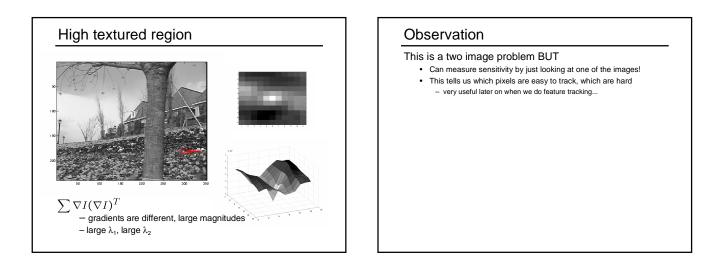

Errors in Lukas-Kanade

What are the potential causes of errors in this procedure?

- Suppose A^TA is easily invertible
- · Suppose there is not much noise in the image

When our assumptions are violated

- Brightness constancy is **not** satisfied
- The motion is not small
- A point does not move like its neighbors
 - window size is too large
 - what is the ideal window size?

Improving accuracy

Recall our small motion assumption

$$0 = I(x + u, y + v) - H(x, y)$$

 $\approx I(x,y) + I_x u + I_y v - H(x,y)$

This is not exact

- To do better, we need to add higher order terms back in:
 - $= I(x, y) + I_x u + I_y v +$ higher order terms H(x, y)

This is a polynomial root finding problem

- Can solve using Newton's method
 - Also known as Newton-Raphson method
 Today's reading (first four pages)
 - » http://www.ulib.org/webRoot/Books/Numerical_Recipes/bookcpdf/c9-4.pdf
- Lukas-Kanade method does one iteration of Newton's method

1D case

- Better results are obtained via more iterations

Iterative Refinement

Iterative Lukas-Kanade Algorithm

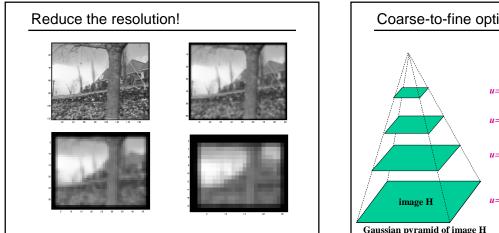

- 1. Estimate velocity at each pixel by solving Lucas-Kanade equations
- 2. Warp H towards I using the estimated flow field
- use image warping techniques
- 3. Repeat until convergence

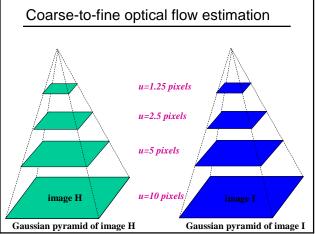

Revisiting the small motion assumption

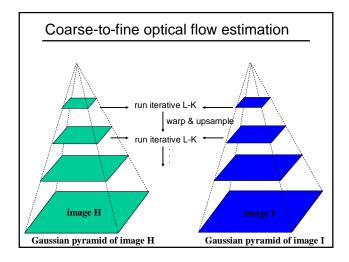

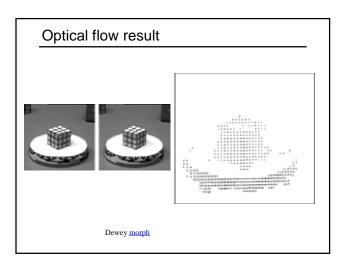

Is this motion small enough?

- Probably not-it's much larger than one pixel (2nd order terms dominate)
- · How might we solve this problem?

Motion tracking

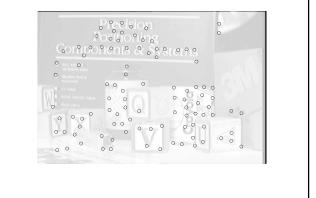

Suppose we have more than two images

- How to track a point through all of the images?
 - In principle, we could estimate motion between each pair of consecutive frames
 - Given point in first frame, follow arrows to trace out it's path
 Problem: DRIFT
 - small errors will tend to grow and grow over time—the point will drift way off course

Feature Tracking

- · Choose only the points ("features") that are easily tracked
- How to find these features?
 - windows where $\sum
 abla I (
 abla I)^T$ has two large eigenvalues
- Called the Harris Corner Detector

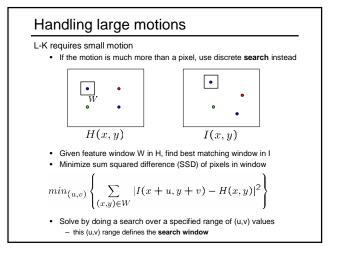

Feature Detection

Tracking features

Feature tracking

- Compute optical flow for that feature for each consecutive H, I
- When will this go wrong?
 - Occlusions-feature may disappear
 - need mechanism for deleting, adding new featuresChanges in shape, orientation
 - allow the feature to deform
 - Changes in color
 - Large motions
 - will pyramid techniques work for feature tracking?

Tracking Over Many Frames

Feature tracking with m frames

- 1. Select features in first frame
- 2. Given feature in frame i, compute position in i+1
- 3. Select more features if needed
- 4. i=i+1
- 5. If i < m, go to step 2

Issues

- Discrete search vs. Lucas Kanade? - depends on expected magnitude of motion
- discrete search is more flexible Compare feature in frame i to i+1 or frame 1 to i+1?
- affects tendency to drift ..
- How big should search window be?
- too small: lost features. Too large: slow

Incorporating Dynamics

Idea

- · Can get better performance if we know something about the way points move
- · Most approaches assume constant velocity

$$\dot{\mathbf{x}}_{i+1} = \dot{\mathbf{x}}_i$$

$$x_{i+1} = 2x_i - x_{i-1}$$

or constant acceleration

$$\ddot{\mathbf{x}}_{i+1} = \ddot{\mathbf{x}}_i$$

- $\mathbf{x}_{i+1} = 3\mathbf{x}_i 3\mathbf{x}_{i-1} + \mathbf{x}_{i-2}$
- Use above to predict position in next frame, initialize search

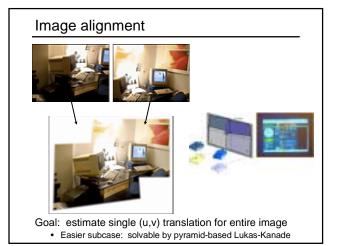

Feature tracking demo

Summary

Things to take away from this lecture

Optical flow problem definition
Aperture problem and how it arises

- Assumptions
- Brightness constancy, small motion, smoothness
 Derivation of optical flow constraint equation
 Lukas-Kanade equation
- LUKAS-KANADE EQUATION
 Derivation
 Conditions for solvability
 meanings of eigenvalues and eigenvectors
 Iterative refinement

 - Newton's method
 Coarse-to-fine flow estimation
- Coalse-to-intensive scantaux.
 Feature tracking
 Harris feature detector
 L-K vs. discrete search method
 Tracking over many frames
 Prediction using dynamics
- Applications
 MPEG video compression
