Today's Readings

- Trucco & Verri, 8.3 8.4 (skip 8.3.3, read only top half of p. 199)
- <u>Newton's method Wikpedia page</u>

Why estimate motion?

Lots of uses

- · Track object behavior
- · Correct for camera jitter (stabilization)
- Align images (mosaics)
- 3D shape reconstruction
- · Special effects
- Video slow motion
- Video super-resolution

Motion estimation

Input: sequence of images
Output: point correspondence

Feature tracking

- we've seen this already (e.g., SIFT)
- · can modify this to be more efficient

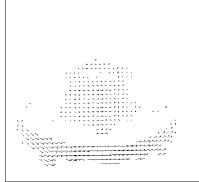

Pixel tracking: "Optical Flow"

· today's lecture

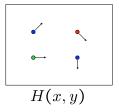

Optical flow

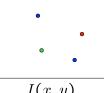

Problem definition: optical flow

I(x,y)

How to estimate pixel motion from image H to image I?

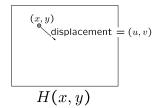

- · Solve pixel correspondence problem
 - given a pixel in H, look for nearby pixels of the same color in I

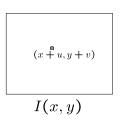

Key assumptions

- color constancy: a point in H looks the same in I
 - For grayscale images, this is brightness constancy
- · small motion: points do not move very far

This is called the **optical flow** problem

Optical flow constraints (grayscale images)

Let's look at these constraints more closely

- brightness constancy: Q: what's the equation?
- small motion: (u and v are less than 1 pixel)
 - suppose we take the Taylor series expansion of I:

$$\begin{split} I(x+u,y+v) &= I(x,y) + \frac{\partial I}{\partial x} u + \frac{\partial I}{\partial y} v + \text{higher order terms} \\ &\approx I(x,y) + \frac{\partial I}{\partial x} u + \frac{\partial I}{\partial y} v \end{split}$$

Optical flow equation

Combining these two equations

$$0 = I(x+u, y+v) - H(x, y)$$
 shorthand: $I_x = \frac{\partial I}{\partial x}$
$$\approx I(x, y) + I_x u + I_y v - H(x, y)$$

$$\approx (I(x,y) - H(x,y)) + I_x u + I_y v$$

$$\approx I_t + I_x u + I_y v$$

$$\approx I_t + \nabla I \cdot [u \ v]$$

In the limit as u and v go to zero, this becomes exact

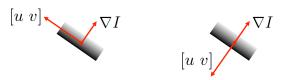

$$0 = I_t + \nabla I \cdot \left[\frac{\partial x}{\partial t} \, \frac{\partial y}{\partial t} \right]$$

Optical flow equation

$$0 = I_t + \nabla I \cdot [u \ v]$$

Q: how many unknowns and equations per pixel?

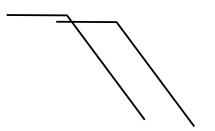

Intuitively, what does this constraint mean?

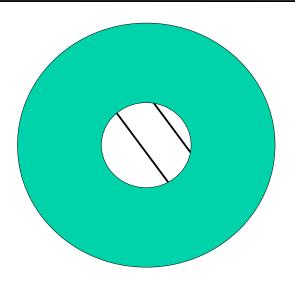

- · The component of the flow in the gradient direction is determined
- The component of the flow parallel to an edge is unknown

This explains the Barber Pole illusion http://www.sandlotscience.com/Ambiguous/Barberpole Illusion.htm

Aperture problem

Aperture problem

Solving the aperture problem

How to get more equations for a pixel?

- Basic idea: impose additional constraints
 - most common is to assume that the flow field is smooth locally
 - one method: pretend the pixel's neighbors have the same (u,v)
 - » If we use a 5x5 window, that gives us 25 equations per pixel!

$$0 = I_t(\mathbf{p_i}) + \nabla I(\mathbf{p_i}) \cdot [u \ v]$$

$$\begin{bmatrix} I_x(\mathbf{p_1}) & I_y(\mathbf{p_1}) \\ I_x(\mathbf{p_2}) & I_y(\mathbf{p_2}) \\ \vdots & \vdots \\ I_x(\mathbf{p_{25}}) & I_y(\mathbf{p_{25}}) \end{bmatrix} \begin{bmatrix} u \\ v \end{bmatrix} = - \begin{bmatrix} I_t(\mathbf{p_1}) \\ I_t(\mathbf{p_2}) \\ \vdots \\ I_t(\mathbf{p_{25}}) \end{bmatrix}$$

$$A \qquad d \qquad b$$

$$25 \times 2 \qquad 2 \times 1 \qquad 25 \times 1$$

Lucas-Kanade flow

Prob: we have more equations than unknowns

$$\underset{25 \times 2}{A} \underset{27 \times 1}{d = b} \longrightarrow \text{minimize } ||Ad - b||^2$$

Solution: solve least squares problem

• minimum least squares solution given by solution (in d) of:

$$(A^T A) \underset{2 \times 2}{d} = A^T b$$

$$\begin{bmatrix} \sum I_x I_x & \sum I_x I_y \\ \sum I_x I_y & \sum I_y I_y \end{bmatrix} \begin{bmatrix} u \\ v \end{bmatrix} = - \begin{bmatrix} \sum I_x I_t \\ \sum I_y I_t \end{bmatrix}$$

$$A^T A \qquad A^T b$$

- The summations are over all pixels in the K x K window
- This technique was first proposed by Lucas & Kanade (1981)
 - described in Trucco & Verri reading

Conditions for solvability

· Optimal (u, v) satisfies Lucas-Kanade equation

$$\begin{bmatrix} \sum I_x I_x & \sum I_x I_y \\ \sum I_x I_y & \sum I_y I_y \end{bmatrix} \begin{bmatrix} u \\ v \end{bmatrix} = - \begin{bmatrix} \sum I_x I_t \\ \sum I_y I_t \end{bmatrix}$$

$$A^T A \qquad A^T b$$

When is This Solvable?

- A^TA should be invertible
- A^TA should not be too small due to noise
 - eigenvalues λ_1 and λ_2 of **A^TA** should not be too small
- A^TA should be well-conditioned
 - $-\lambda_1/\lambda_2$ should not be too large (λ_1 = larger eigenvalue)

Does this look familiar?

A^TA is the Harris matrix

Observation

This is a two image problem BUT

- · Can measure sensitivity by just looking at one of the images!
- · This tells us which pixels are easy to track, which are hard
 - very useful later on when we do feature tracking...

Errors in Lucas-Kanade

What are the potential causes of errors in this procedure?

- Suppose A^TA is easily invertible
- · Suppose there is not much noise in the image

When our assumptions are violated

- Brightness constancy is not satisfied
- · The motion is **not** small
- A point does not move like its neighbors
 - window size is too large
 - what is the ideal window size?

Improving accuracy

Recall our small motion assumption

$$0 = I(x + u, y + v) - H(x, y)$$
$$\approx I(x, y) + I_x u + I_y v - H(x, y)$$

This is not exact

• To do better, we need to add higher order terms back in:

$$=I(x,y)+I_xu+I_yv+$$
 higher order terms $-H(x,y)$

This is a polynomial root finding problem

· Can solve using Newton's method

1D case

Also known as Newton-Raphson method

on board

Today's reading (first four pages)

- - » http://www.library.cornell.edu/nr/bookcpdf/c9-4.pdf
- · Approach so far does one iteration of Newton's method
 - Better results are obtained via more iterations

Iterative Refinement

Iterative Lucas-Kanade Algorithm

- 1. Estimate velocity at each pixel by solving Lucas-Kanade equations
- 2. Warp H towards I using the estimated flow field
 - use image warping techniques
- 3. Repeat until convergence

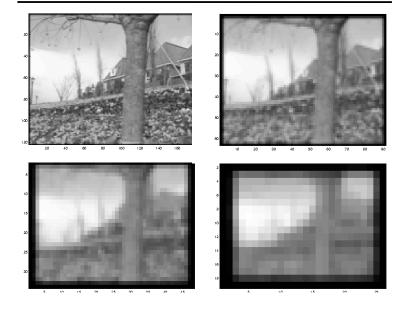

Revisiting the small motion assumption

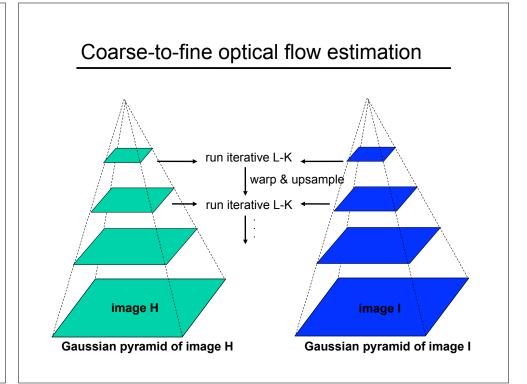

Is this motion small enough?

- Probably not—it's much larger than one pixel (2nd order terms dominate)
- · How might we solve this problem?

Reduce the resolution!

Coarse-to-fine optical flow estimation u=1.25 pixels u=2.5 pixels u=5 pixels image H Gaussian pyramid of image H Gaussian pyramid of image I
