Geometry and Cameras

Today's agenda

- How biological vision understands geometry
- Brief history of geometric vision
- Geometric transformations
- Pinhole camera
- The Pinhole camera transformation

Today's agenda

- How biological vision understands geometry
- Brief history of geometric vision
- Geometric transformations
- Pinhole camera
- The Pinhole camera transformation

Our goal: Recover the 3D geometry of the world

J. Vermeer, *Music Lesson*, 1662

Let's Take a Picture!

Single-view Ambiguity

- Given a camera and an image, we only know the ray corresponding to each pixel.
- We don't know how far away the object the ray was reflected from
 - We don't have enough constraints to solve for X (depth)

Single-view Ambiguity

http://en.wikipedia.org/wiki/Ames_room

Single-view Ambiguity

Resolving Single-view Ambiguity

- Shoot light (lasers etc.) out of your eyes!
- Con: not so biologically plausible, dangerous?

Resolving Single-view Ambiguity

- Shoot light (lasers etc.) out of your eyes!
- Con: not so biologically plausible, dangerous?

How do humans estimate depth? **Two eyes!**

- Stereo: given 2 calibrated cameras in different views and correspondences, can solve for X

Stereo photography and stereo viewers

Take two pictures of the same subject from two slightly different viewpoints and display so that each eye sees only one of the images.

Invented by Sir Charles Wheatstone, 1838

Image from fisher-price.com

<http://www.johnsonshawmuseum.org>

http://www.well.com/~jimmg/stereo/stereo_list.html

http://www.well.com/~jimmg/stereo/stereo_list.html

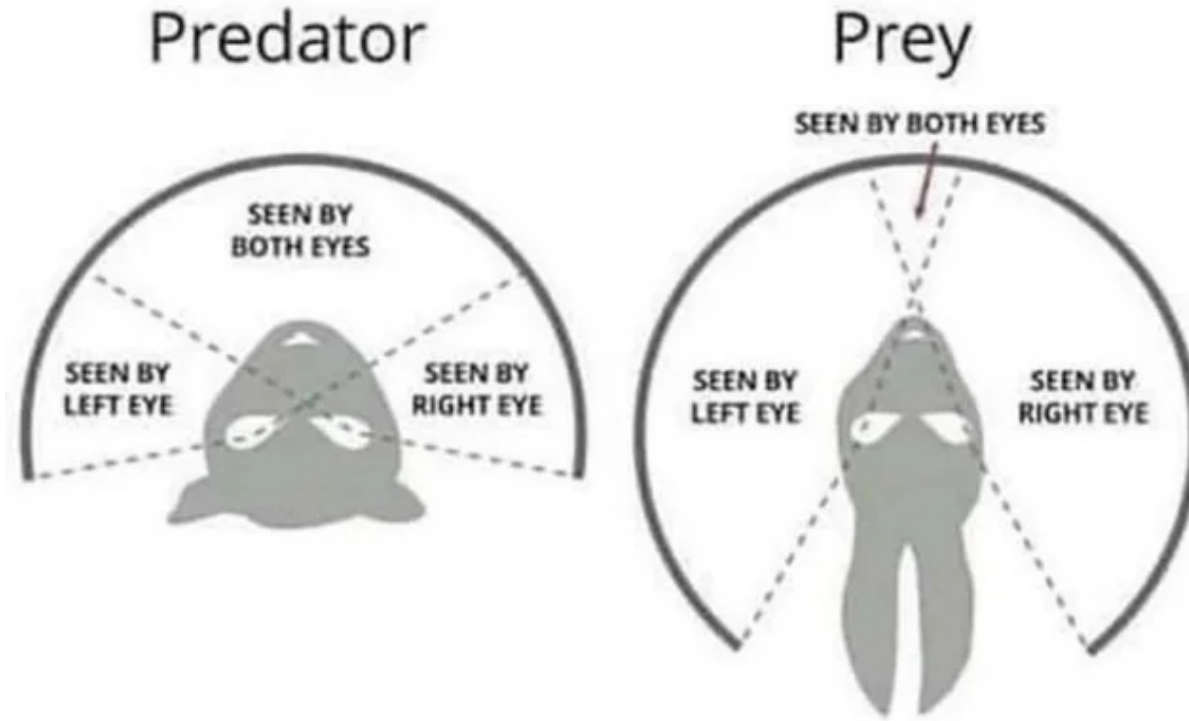

Not all animals see stereo:

Prey animals are Stereoblind
(large field of view to spot predators)

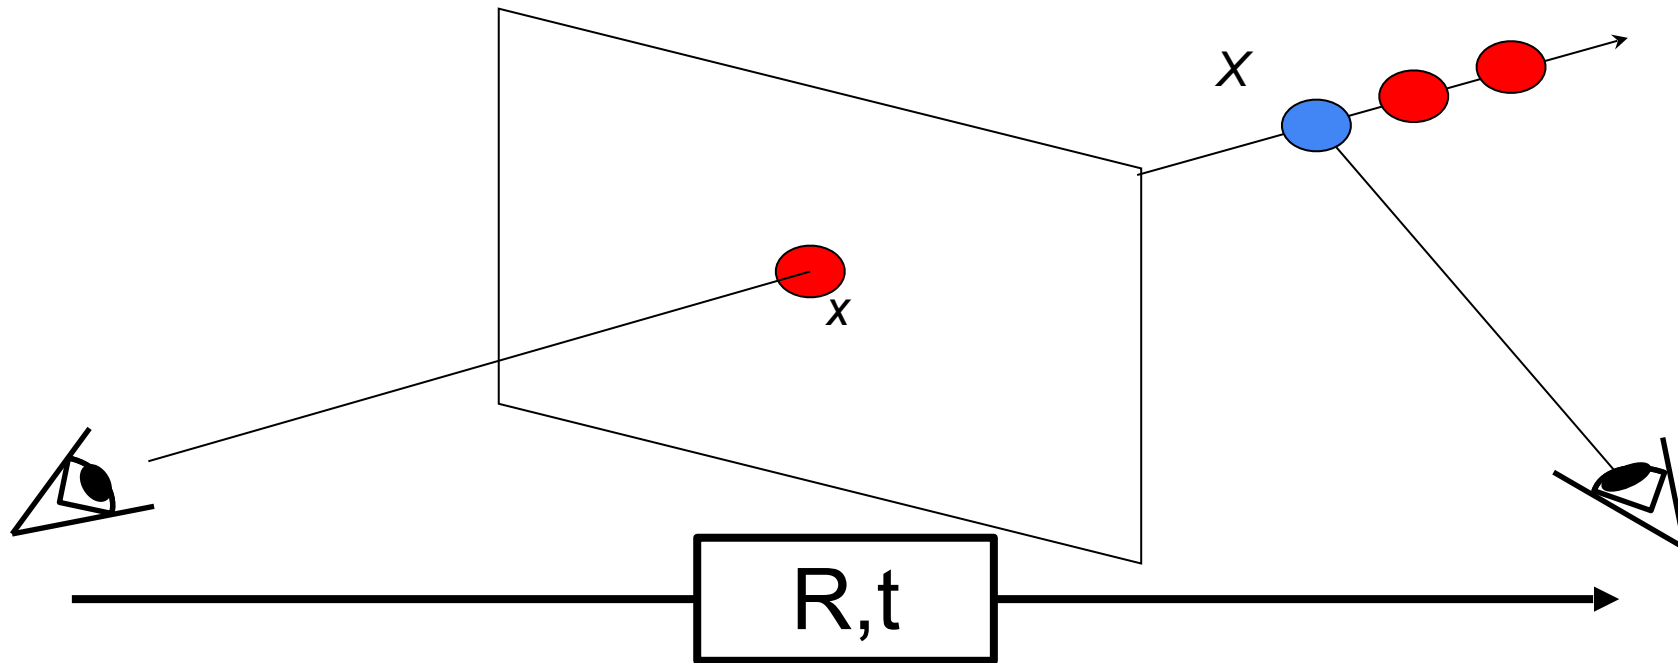

Not all animals see stereo:

Prey animals are Stereoblind
(large field of view to spot predators)

Resolving Single-view Ambiguity

- One option: move the camera, find matching correspondences
- If you know how you moved in the physical world and have corresponding points in image space, you can solve for X

We can estimate depth from a single image. But how?

- You haven't been here before, yet you probably have a fairly good understanding of this scene.

We use pictorial cues – such as **familiar objects**

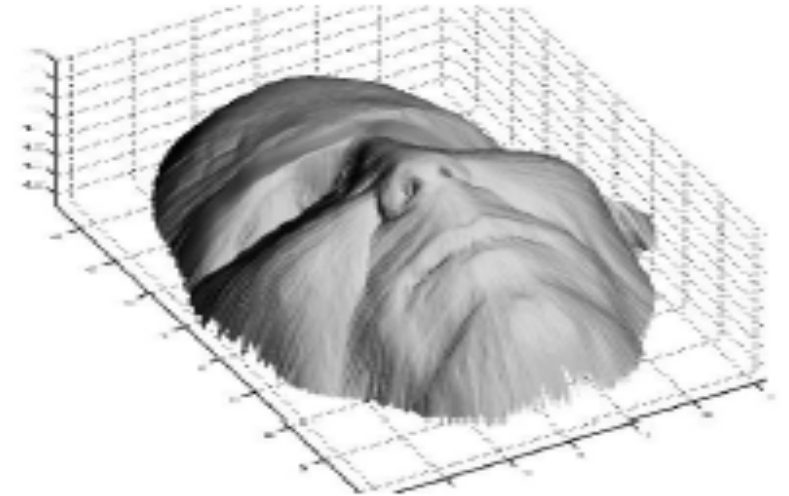

We use pictorial cues – such as **shading**

a)

b)

c)

We use pictorial cues – such as **perspective effects**

Reality of 3D Perception

- 3D perception is absurdly **complex** and involves integration of many cues:
 - **Learned cues** for 3D
 - **Stereo** between eyes
 - Stereo via **motion**
 - Integration of known motion signals to **muscles** (efferent copy), acceleration sensed via ears
 - Past experience of **touching** objects
- All connect: learned cues from 3D probably come from stereo/motion cues in large part

Regardless, illusions can still fool this complex system

Ames illusion persists (in a weaker form) even if you have stereo vision –guessing the texture is rectilinear is usually incredibly reliable

Today's agenda

- How biological vision understands geometry
- **Brief history of geometric vision**
- Geometric transformations
- Pinhole camera
- The Pinhole camera transformation

Simplified Image Formation

Figure: R. Szeliski

Geometric vision is an **ill-posed** inverse problem

Pixel Matrix

217	191	252	255	239
102	80	200	146	138

115	129	83	112	67
94	114	105	111	89

Objects	Material
Shape/Geometry	Motion
Semantics	3D Pose

Brief History of Geometric Vision

- 2020-: geometry + learning
- 2010s: deep learning
- 2000s: local detectors and descriptors
- 1990s: digital camera, 3D geometry estimation
- 1980s: epipolar geometry (stereo)
- ...

Brief History of Geometric Vision

- 1860s: Willème invented photo-sculptures
- 1850s: birth of photogrammetry [Laussedat]
- 1840s: panoramic photography
- 1822-39: birth of photography [Niépce, Daguerre]
- 1773: general 3-point pose estimation [Lagrange]
- 1715: basic intrinsic calibration (pre-photography!) [Taylor]
- 1700's: topographic mapping from perspective drawings [Beautemps-Beaupré, Kappeler]

Niépce, "La Table Servie", 1822

Brief History of Geometric Vision

- 15th century: start of mathematical treatment of 3D, [first AR app?](#)

Augmented reality invented by Filippo Brunelleschi (1377-1446)?

Tavoletta prospettica di Brunelleschi

Brief History of Geometric Vision

- 5th century BC: principles of pinhole camera, a.k.a. camera obscura
 - China: 5th century BC
 - Greece: 4th century BC
 - Egypt: 11th century
 - Throughout Europe: from 11th century onwards

First mention ...

Chinese philosopher Mozi
(470 to 390 BC)

First camera?

Greek philosopher Aristotle
(384 to 322 BC)

Today's agenda

- How biological vision understands geometry
- Brief history of geometric vision
- **Geometric transformations**
- Pinhole camera
- The Pinhole camera transformation

Points

2D points: $\mathbf{x} = (x, y) \in \mathcal{R}^2$ or column vector $\mathbf{x} = \begin{bmatrix} x \\ y \end{bmatrix}$

3D points: $\mathbf{x} = (x, y, z) \in \mathcal{R}^3$ (often noted \mathbf{X} or \mathbf{P})

Homogeneous coordinates: append a 1

Why? $\bar{\mathbf{x}} = (x, y, 1)$

$\bar{\mathbf{x}} = (x, y, z, 1)$

Everything is easier in Projective Space

- 2D Lines:

Representation: $l = (a, b, c)$

Equation: $ax + by + c = 0$

In homogeneous coordinates: $\bar{x}^T l = 0$

General idea: homogenous coordinates unlock the full power of linear algebra!

Homogeneous coordinates in 2D

2D Projective Space: $\mathcal{P}^2 = \mathcal{R}^3 - (0, 0, 0)$ (same story in 3D with \mathcal{P}^3)

- heterogeneous \rightarrow homogeneous $\begin{bmatrix} x \\ y \end{bmatrix} \Rightarrow \begin{bmatrix} x \\ y \\ 1 \end{bmatrix}$
- homogeneous \rightarrow heterogeneous $\begin{bmatrix} x \\ y \\ w \end{bmatrix} \Rightarrow \begin{bmatrix} x/w \\ y/w \end{bmatrix}$
- points differing only by scale are *equivalent*: $(x, y, w) \sim \lambda (x, y, w)$

$$\tilde{\mathbf{x}} = (\tilde{x}, \tilde{y}, \tilde{w}) = \tilde{w}(x, y, 1) = \tilde{w}\bar{\mathbf{x}}$$

The camera as a coordinate transformation

A camera is a mapping
from: the 3D world
to: a 2D image

Cameras and objects can move!

Figure: R. Szeliski

2D Transformations in pixel **locations** (*not pixel values*)

Scaling

$$\begin{bmatrix} s_x & 0 \\ 0 & s_y \end{bmatrix} \times \begin{bmatrix} x \\ y \end{bmatrix} = \begin{bmatrix} s_x x \\ s_y y \end{bmatrix}$$

A p p'

Rotation

$$x' = x \cos \theta - y \sin \theta$$

$$y' = x \sin \theta + y \cos \theta$$

or in matrix form:

$$\begin{bmatrix} x' \\ y' \end{bmatrix} = \begin{bmatrix} \cos \theta & -\sin \theta \\ \sin \theta & \cos \theta \end{bmatrix} \begin{bmatrix} x \\ y \end{bmatrix}$$

Rotation matrix:

- Inverse is transpose
- Orthonormal

$$\mathbf{R} \cdot \mathbf{R}^T = \mathbf{R}^T \cdot \mathbf{R} = \mathbf{I}$$

$$\det(\mathbf{R}) = 1$$

2D Translation

$$x' = x + t_x$$
$$y' = y + t_y$$

As a matrix?

2D Translation with homogeneous coordinates

$$p = \begin{bmatrix} x \\ y \\ 1 \end{bmatrix} \rightarrow \begin{bmatrix} x \\ y \\ 1 \end{bmatrix}$$

$$t = \begin{bmatrix} t_x \\ t_y \\ 1 \end{bmatrix} \rightarrow \begin{bmatrix} t_x \\ t_y \\ 1 \end{bmatrix}$$

$$p' = Tp$$

$$p' \rightarrow \begin{bmatrix} x + t_x \\ y + t_y \\ 1 \end{bmatrix} = \begin{bmatrix} 1 & 0 & t_x \\ 0 & 1 & t_y \\ 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} x \\ y \\ 1 \end{bmatrix} = \begin{bmatrix} \mathbf{I} & \mathbf{t} \\ \mathbf{0} & 1 \end{bmatrix} p = Tp$$

Euclidean transformations: rotation + translation

Euclidean (rigid):
rotation + translation

SE(2): Special Euclidean group
Important in robotics:
describes poses on plane

$$\begin{bmatrix} \cos \theta & -\sin \theta & t_x \\ \sin \theta & \cos \theta & t_y \\ 0 & 0 & 1 \end{bmatrix}$$

How many degrees of freedom?

Similarity = Euclidean + scaling equally in x and y

Similarity:
Scaling
+ rotation
+ translation

$$\begin{bmatrix} a & -b & t_x \\ b & a & t_y \\ 0 & 0 & 1 \end{bmatrix}$$

Affine transformation = similarity + no restrictions on scaling

Properties of affine transformations:

- arbitrary 6 Degrees Of Freedom
- lines map to lines
- parallel lines map to parallel lines
- ratios are preserved

$$\begin{bmatrix} x' \\ y' \\ w' \end{bmatrix} = \begin{bmatrix} a & b & c \\ d & e & f \\ 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} x \\ y \\ w \end{bmatrix}$$

Projective transformation (homography)

Properties of projective transformations:

- 8 degrees of freedom
- lines map to lines
- parallel lines do not necessarily map to parallel lines
- ratios are not necessarily preserved

$$\begin{bmatrix} x' \\ y' \\ w' \end{bmatrix} = \begin{bmatrix} a & b & c \\ d & e & f \\ g & h & i \end{bmatrix} \begin{bmatrix} x \\ y \\ w \end{bmatrix}$$

Composing Transformations

- Transformations = Matrices => Composition by Multiplication!

$$p' = R_2 R_1 S p$$

In the example above, the result is equivalent to

$$p' = R_2(R_1(Sp))$$

Equivalent to multiply the matrices into single transformation matrix:

$$p' = (R_2 R_1 S) p$$

Order Matters! Transformations from *right to left*.

Scaling & Translating \neq Translating & Scaling

- $$p'' = TSp = \begin{bmatrix} 1 & 0 & t_x \\ 0 & 1 & t_y \\ 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} s_x & 0 & 0 \\ 0 & s_y & 0 \\ 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} x \\ y \\ 1 \end{bmatrix} = \begin{bmatrix} s_x & 0 & t_x \\ 0 & s_y & t_y \\ 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} x \\ y \\ 1 \end{bmatrix} = \begin{bmatrix} s_x x + t_x \\ s_y y + t_y \\ 1 \end{bmatrix}$$

$$p''' = STp = \begin{bmatrix} s_x & 0 & 0 \\ 0 & s_y & 0 \\ 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} 1 & 0 & t_x \\ 0 & 1 & t_y \\ 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} x \\ y \\ 1 \end{bmatrix} = \begin{bmatrix} s_x & 0 & s_x t_x \\ 0 & s_y & s_y t_y \\ 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} x \\ y \\ 1 \end{bmatrix} = \begin{bmatrix} s_x x + s_x t_x \\ s_y y + s_y t_y \\ 1 \end{bmatrix}$$

Scaling + Rotation + Translation

$$p' = (T R S) p$$

$$p' = TRSp = \begin{bmatrix} 1 & 0 & t_x \\ 0 & 1 & t_y \\ 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} \cos \theta & -\sin \theta & 0 \\ \sin \theta & \cos \theta & 0 \\ 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} s_x & 0 & 0 \\ 0 & s_y & 0 \\ 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} x \\ y \\ 1 \end{bmatrix}$$

$$= \begin{bmatrix} \cos \theta & -\sin \theta & t_x \\ \sin \theta & \cos \theta & t_y \\ 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} s_x & 0 & 0 \\ 0 & s_y & 0 \\ 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} x \\ y \\ 1 \end{bmatrix}$$

$$= \begin{bmatrix} R & t \\ 0 & 1 \end{bmatrix} \begin{bmatrix} S & 0 \\ 0 & 1 \end{bmatrix} \begin{bmatrix} x \\ y \\ 1 \end{bmatrix} = \boxed{\begin{bmatrix} RS & t \\ 0 & 1 \end{bmatrix}} \begin{bmatrix} x \\ y \\ 1 \end{bmatrix}$$

This is the form of the
general-purpose
transformation matrix

Today's agenda

- How biological vision understands geometry
- Brief history of geometric vision
- Geometric transformations
- **Pinhole camera**
- The Pinhole camera transformation

Reminder: Camera Obscura

- 5th century BC: principles of pinhole camera, a.k.a. camera obscura

- China: 5th century BC
- Greece: 4th century BC
- Egypt: 11th century
- Throughout Europe: from 11th century onwards

First mention ...

Chinese philosopher Mozi
(470 to 390 BC)

First camera?

Greek philosopher Aristotle
(384 to 322 BC)

Pinhole imaging

real-world object

Pinhole imaging

digital sensor
(CCD or
CMOS)

real-world
object

What does the
image on the
sensor look like?

Each scene point contributes to only one sensor pixel

Pinhole imaging

real-world
object

copy of real-world object
(inverted and scaled)

Bare-sensor imaging (without a pinhole camera)

Bare-sensor imaging (without a pinhole camera)

All scene points contribute to all sensor pixels

Cameras & Lenses

- **Focal length** determines the magnification of the image projected onto the image plane.
- **Aperture** determines the light intensity of that image pixels.

Source wikipedia

<https://tinyurl.com/cse455-11>

What's going on there?

The buildings look distorted and bending towards each other.

Beyond Pinholes: Radial Distortion

- Common in wide-angle lenses or for special applications (e.g., automotive)
- Creates a projective transformation
- Usually handled through solving for non-linear terms and then correcting image

No Distortion

Barrel Distortion

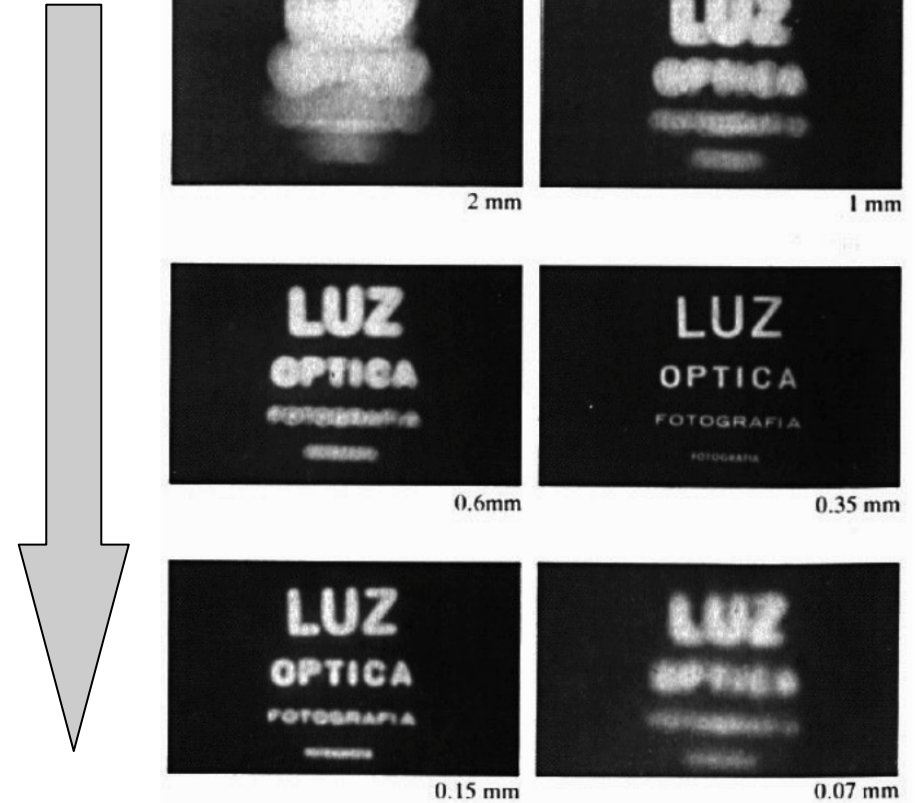

Pincushion Distortion

Corrected Barrel Distortion

Cameras & Lenses

Decreasing
aperture
size

What happens with a smaller aperture?

- Less light passes through
- Less diffraction effect and clearer image

Pinhole is the miniscule aperture, resulting in the least amount of light and clearest image

Describing both lens and pinhole cameras

For this course, we focus on the pinhole model.

- Similar to thin lens model in Physics: central rays are not deviated.
- Assumes lens camera in focus.
- Useful approximation but ignores important lens distortions.

Today's agenda

- How biological vision understands geometry
- Brief history of geometric vision
- Geometric transformations
- Pinhole camera
- **The Pinhole camera transformation**

The pinhole camera

image plane

The (rearranged) pinhole camera

virtual image plane

real-world
object

The (rearranged) pinhole camera

What is the transformation $\mathbf{x} = \mathbf{P}\mathbf{X}$?

Pinhole Camera Matrix

Because all transformations are done using homogeneous coordinate system, all transformations are correct up to some scale

λ

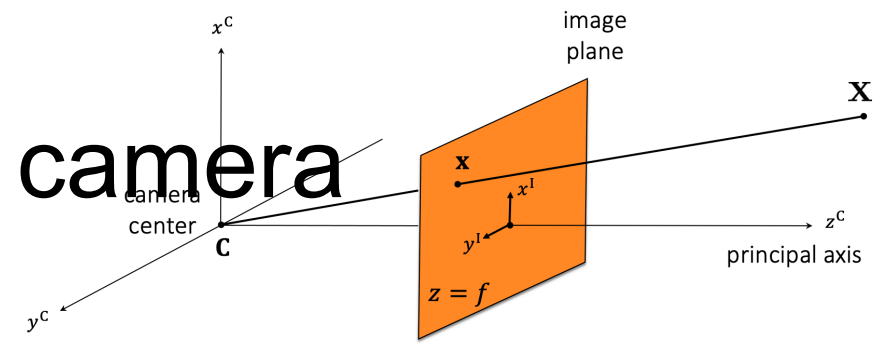

$$\begin{aligned} \mathbf{x} &= \mathbf{P}\mathbf{X} \\ \lambda \tilde{\mathbf{x}} &= \mathbf{P}\tilde{\mathbf{X}} \end{aligned}$$

$$\begin{bmatrix} x \\ y \\ z \end{bmatrix} \sim \begin{bmatrix} p_1 & p_2 & p_3 & p_4 \\ p_5 & p_6 & p_7 & p_8 \\ p_9 & p_{10} & p_{11} & p_{12} \end{bmatrix} \begin{bmatrix} X \\ Y \\ Z \\ 1 \end{bmatrix}$$

image coordinates 3×1 camera matrix 3×4 world (camera) coordinates 4×1

2D view of the (rearranged) pinhole camera

$$\frac{x}{X} = \frac{f}{Z}$$

Pinhole Camera Matrix

Transformation from camera coordinates to image coordinates:

$$[X \quad Y \quad Z]^T \mapsto [fX/Z \quad fY/Z]^T$$

General camera model *in homogeneous coordinates*:

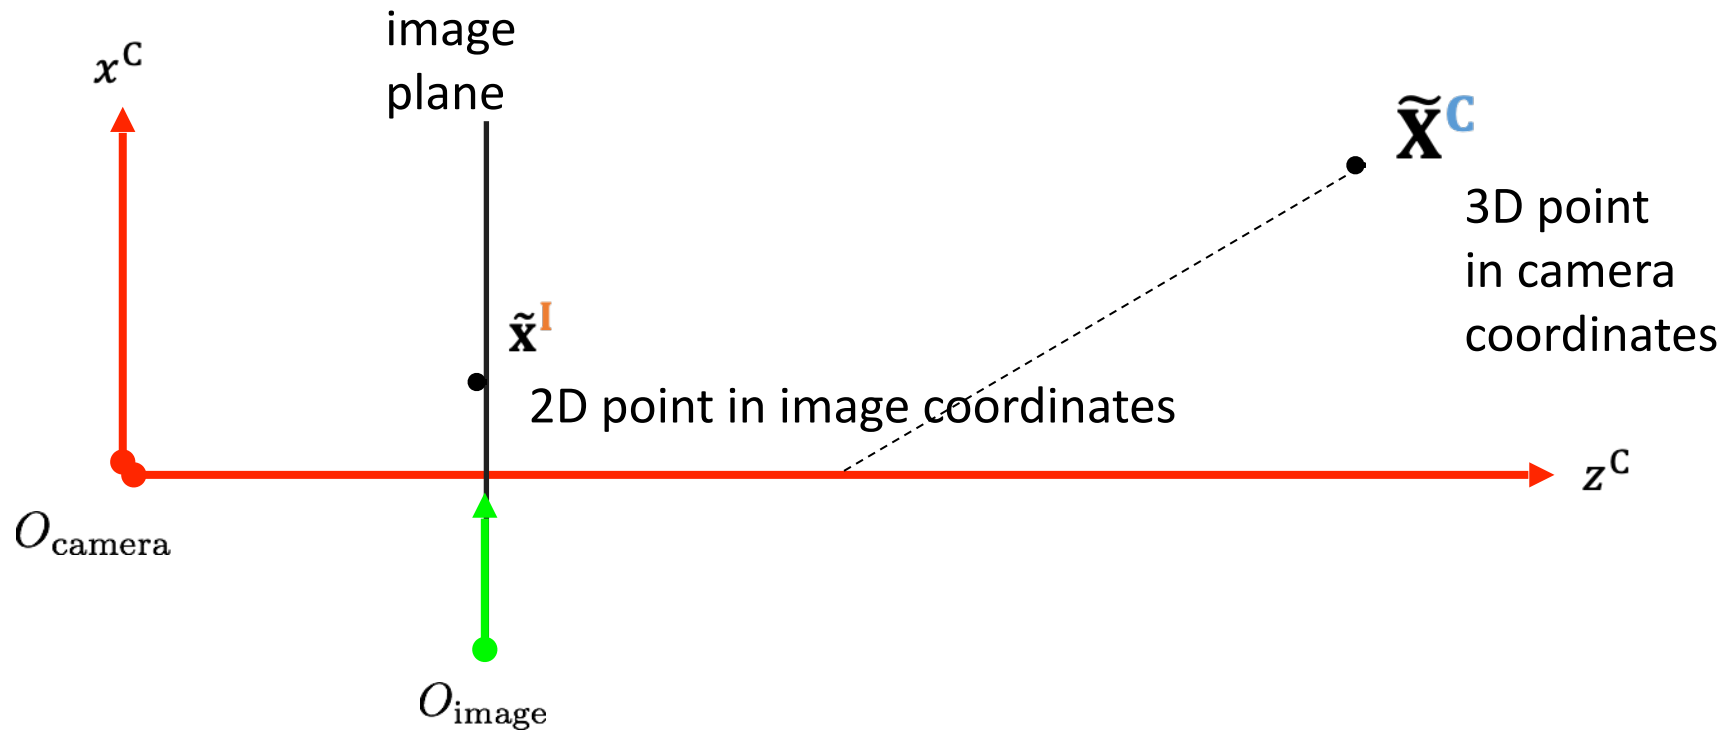

$$\begin{bmatrix} x \\ y \\ z \end{bmatrix} \sim \begin{bmatrix} p_1 & p_2 & p_3 & p_4 \\ p_5 & p_6 & p_7 & p_8 \\ p_9 & p_{10} & p_{11} & p_{12} \end{bmatrix} \begin{bmatrix} X \\ Y \\ Z \\ 1 \end{bmatrix}$$

Pinhole camera has a much simpler projection matrix (assume only scaling):

$$\mathbf{P} = \begin{bmatrix} f & 0 & 0 & 0 \\ 0 & f & 0 & 0 \\ 0 & 0 & 1 & 0 \end{bmatrix} \quad \begin{bmatrix} fX \\ fY \\ Z \end{bmatrix} \rightarrow \begin{bmatrix} fX/Z \\ fY/Z \end{bmatrix} \quad \text{Reminder: conversion from homogeneous coordinates}$$

Generalizing the camera matrix

In general, the camera and image have *different* coordinate systems.

Generalizing the camera matrix

In particular, the camera origin and image origin may be different:

Q. How does the camera matrix change?

$$\mathbf{P} = \begin{bmatrix} f & 0 & 0 & 0 \\ 0 & f & 0 & 0 \\ 0 & 0 & 1 & 0 \end{bmatrix}$$

Generalizing the camera matrix

In particular, the camera origin and image origin may be different:

Q. How does the camera matrix change?

$$\mathbf{P} = \begin{bmatrix} f & 0 & p_x & 0 \\ 0 & f & p_y & 0 \\ 0 & 0 & 1 & 0 \end{bmatrix} \begin{array}{l} \text{Translate the} \\ \text{camera origin to} \\ \text{image origin} \end{array}$$

Camera matrix decomposition

We can decompose the camera matrix like this:

$$\mathbf{P} = \begin{bmatrix} f & 0 & p_x \\ 0 & f & p_y \\ 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} 1 & 0 & 0 & | & 0 \\ 0 & 1 & 0 & | & 0 \\ 0 & 0 & 1 & | & 0 \end{bmatrix}$$

$$\mathbf{P} = \begin{bmatrix} f & 0 & p_x & 0 \\ 0 & f & p_y & 0 \\ 0 & 0 & 1 & 0 \end{bmatrix}$$

Camera matrix decomposition

We can decompose the camera matrix like this:

$$\mathbf{P} = \begin{bmatrix} f & 0 & p_x \\ 0 & f & p_y \\ 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} 1 & 0 & 0 & | & 0 \\ 0 & 1 & 0 & | & 0 \\ 0 & 0 & 1 & | & 0 \end{bmatrix}$$

(homogeneous) **transformation**
from 2D to 2D, accounting for
focal length f and origin translation

(homogeneous) **perspective projection**
from 3D to 2D, assuming image plane at
 $z = 1$ and shared camera/image origin

Camera matrix decomposition

We can decompose the camera matrix like this:

$$\mathbf{P} = \begin{bmatrix} f & 0 & p_x \\ 0 & f & p_y \\ 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} 1 & 0 & 0 & | & 0 \\ 0 & 1 & 0 & | & 0 \\ 0 & 0 & 1 & | & 0 \end{bmatrix}$$

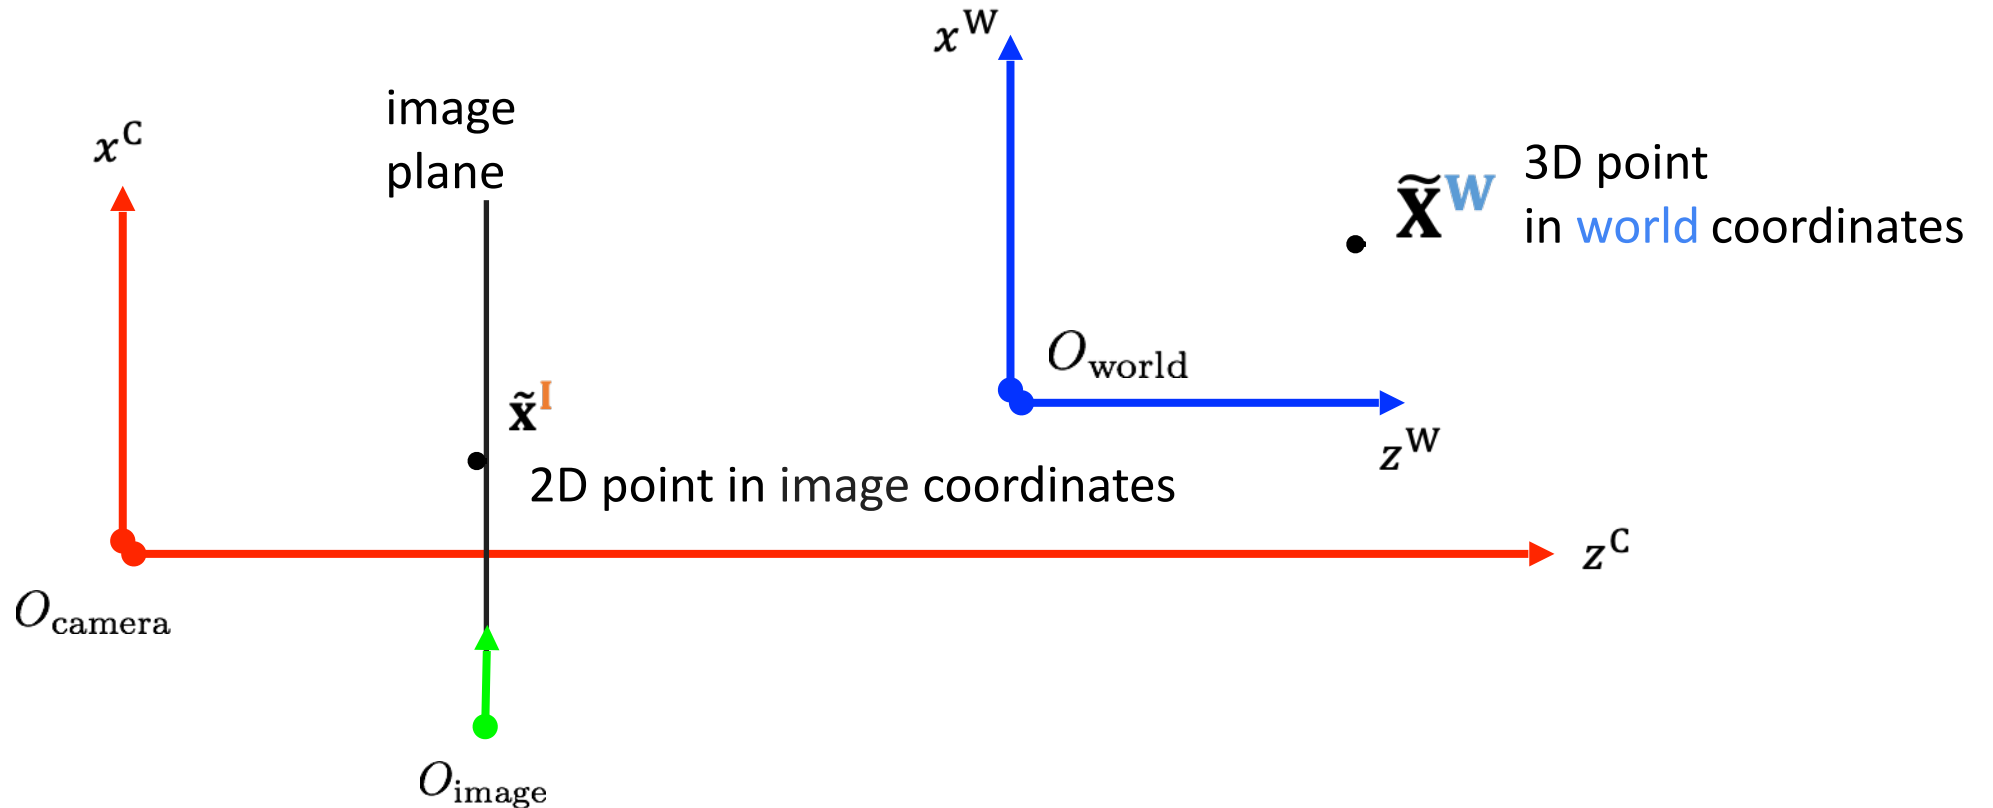

↑
(homogeneous) **transformation**
from 2D to 2D, accounting for
focal length f and origin translation

↑
(homogeneous) **perspective projection**
from 3D to 2D, assuming image plane at
 $z = 1$ and shared camera/image origin

Also written as: $\mathbf{P} = \mathbf{K}[\mathbf{I}|\mathbf{0}]$ where $\mathbf{K} = \begin{bmatrix} f & 0 & p_x \\ 0 & f & p_y \\ 0 & 0 & 1 \end{bmatrix}$ **K is called the camera intrinsics**

Generalizing the camera matrix

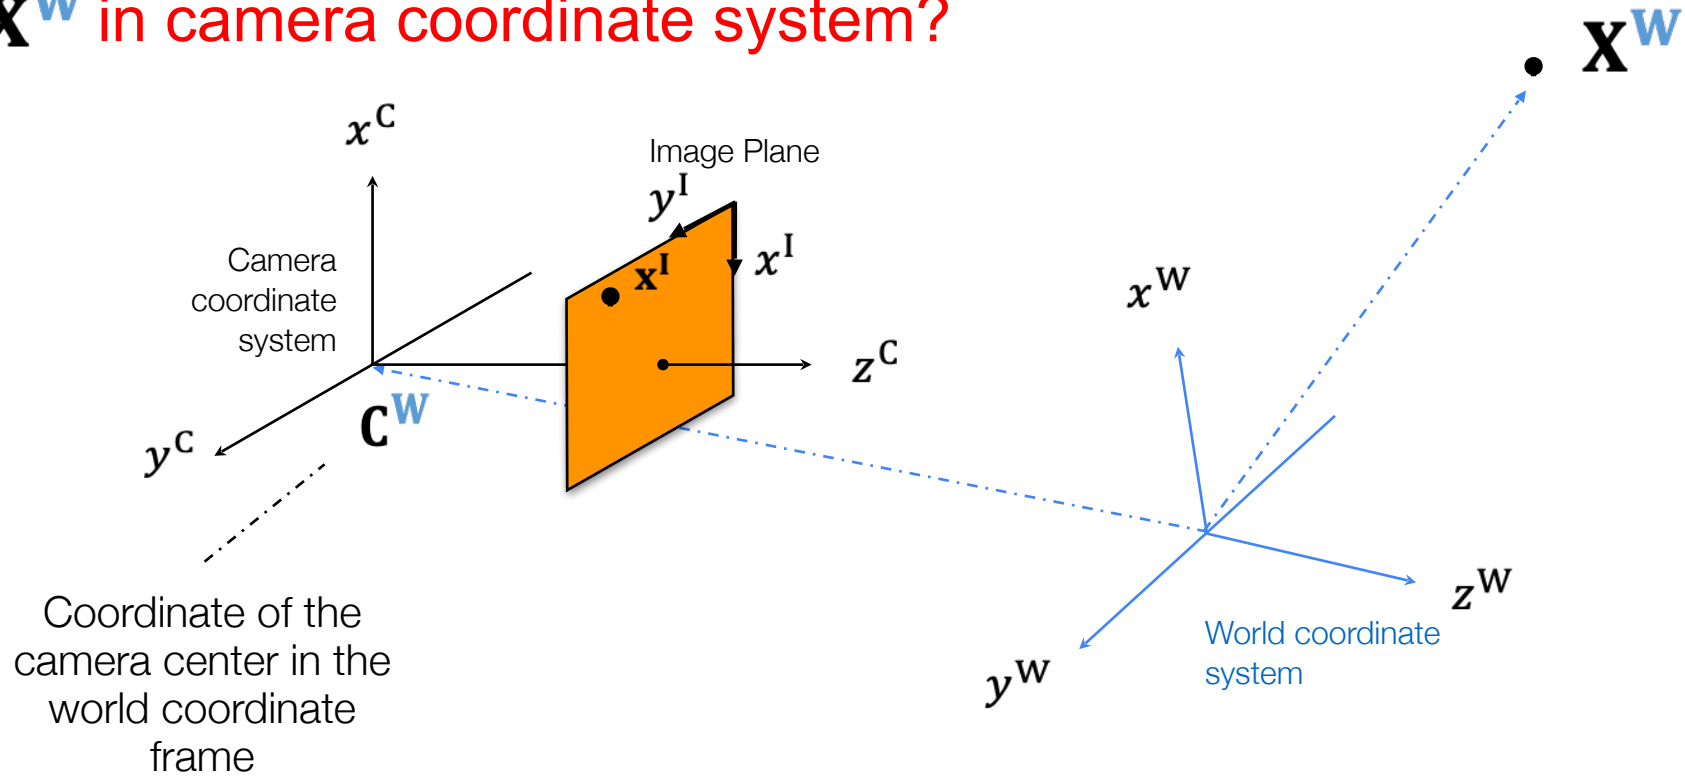

In general, there are **3 different coordinate systems** (camera moves in the world).

World-to-camera coordinate transformation

Let's assume camera is at location C^W in world coordinate system

Q. What is X^W in camera coordinate system?

Note: heterogeneous coordinates for now

World-to-camera coordinate transformation

Why aren't the points aligned?

$X^W - C^W$
translate

World-to-camera coordinate transformation

$$\mathbf{R} (\mathbf{X}^W - \mathbf{C}^W)$$

rotate translate

Coordinate system transformation

In *heterogeneous* coordinates, we have:

$$\mathbf{X}^{\mathbf{C}} = \mathbf{R} (\mathbf{X}^{\mathbf{W}} - \mathbf{C}^{\mathbf{W}})$$

Q. How do we write this transformation in homogeneous coordinates?

Coordinate system transformation

In *heterogeneous* coordinates, we have:

$$\mathbf{X}^{\mathbf{C}} = \mathbf{R} (\mathbf{X}^{\mathbf{W}} - \mathbf{C}^{\mathbf{W}})$$

Q. How do we write this transformation in homogeneous coordinates?

$$\begin{bmatrix} X_c \\ Y_c \\ Z_c \\ 1 \end{bmatrix} = \begin{bmatrix} \mathbf{R} & -\mathbf{RC} \\ \mathbf{0} & 1 \end{bmatrix} \begin{bmatrix} X_w \\ Y_w \\ Z_w \\ 1 \end{bmatrix} \quad \text{or} \quad \tilde{\mathbf{X}}^{\mathbf{C}} = \begin{bmatrix} \mathbf{R} & -\mathbf{RC}^{\mathbf{W}} \\ \mathbf{0} & 1 \end{bmatrix} \tilde{\mathbf{X}}^{\mathbf{W}}$$

Let's update our camera transformation

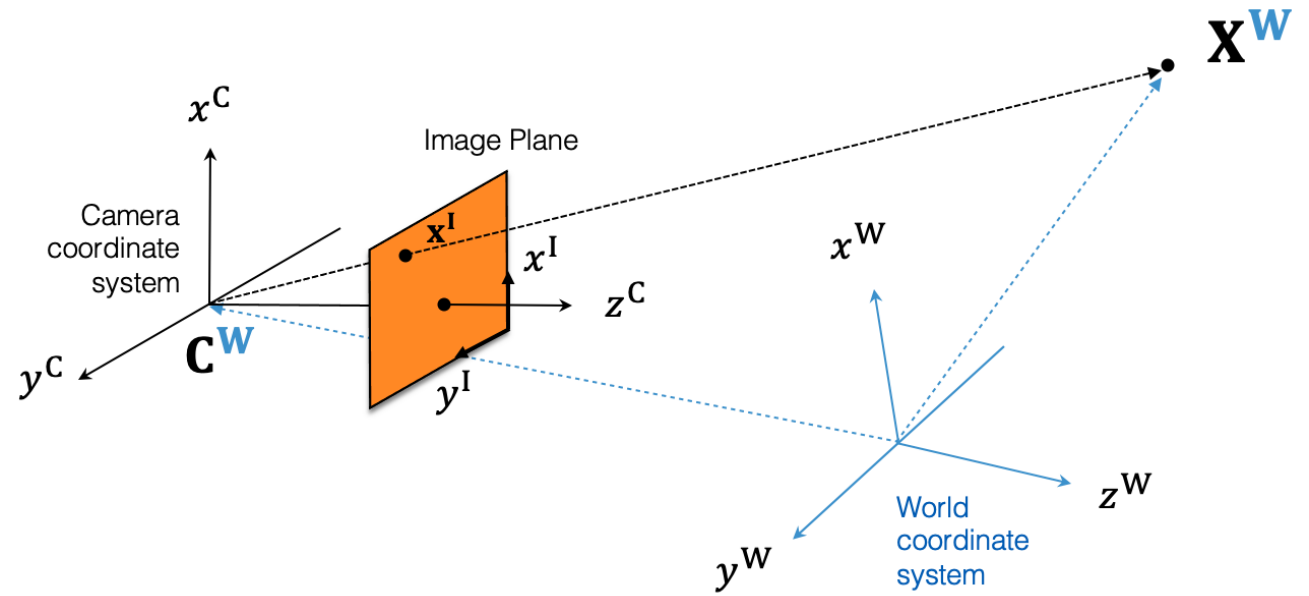

The previous camera transformation we calculated is for homogeneous 3D coordinates in camera coordinate system:

(omitting ~ for simplicity: everything in homogeneous coordinates)

$$\mathbf{x}^I \sim \mathbf{K}[\mathbf{I}|\mathbf{0}]\mathbf{x}^C$$

We also just derived:

$$\mathbf{x}^C = \begin{bmatrix} \mathbf{R} & -\mathbf{RC} \\ \mathbf{0} & 1 \end{bmatrix} \mathbf{x}^W$$

Putting it all together

We can write everything into a single projection: $\mathbf{x}^I \sim \mathbf{K}[\mathbf{I} | \mathbf{0}] \begin{bmatrix} \mathbf{R} & -\mathbf{RC} \\ \mathbf{0} & \mathbf{1} \end{bmatrix} \mathbf{x}^W = \mathbf{P} \mathbf{x}^W$

The camera matrix now looks like:

$$\mathbf{P} = \begin{bmatrix} f & 0 & p_x \\ 0 & f & p_y \\ 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} \mathbf{I} & | & \mathbf{0} \end{bmatrix} \begin{bmatrix} \mathbf{R} & -\mathbf{RC} \\ \mathbf{0} & \mathbf{1} \end{bmatrix}$$

intrinsic parameters (3 x 3):

correspond to camera
internals (image-to-image
transformation)

perspective projection (3 x 4):

maps 3D to 2D points
(camera-to-image
transformation)

extrinsic parameters (4 x 4):

correspond to camera
externals (world-to-camera
transformation)

Putting it all together

We can write everything into a single projection: $\mathbf{x}^I \sim \mathbf{P}\mathbf{X}^W$

The camera matrix now looks like:

$$\mathbf{P} = \begin{bmatrix} f & 0 & p_x \\ 0 & f & p_y \\ 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} \mathbf{R} & \vdots \\ -\mathbf{RC} \end{bmatrix} \begin{matrix} \mathbf{t} \\ \uparrow \end{matrix}$$

intrinsic parameters (3 x 3):
correspond to camera internals
(sensor not at $f = 1$ and origin shift)

extrinsic parameters (3 x 4):
correspond to camera externals
(world-to-image transformation)

General pinhole camera matrix

$$\mathbf{P} = \mathbf{K}[\mathbf{R}|\mathbf{t}] \quad \text{where} \quad \mathbf{t} = -\mathbf{RC}$$

General pinhole camera matrix

$$\mathbf{P} = \mathbf{K}[\mathbf{R}|\mathbf{t}] \quad \text{where} \quad \mathbf{t} = -\mathbf{RC}$$

$$\mathbf{P} = \begin{bmatrix} f & 0 & p_x \\ 0 & f & p_y \\ 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} r_1 & r_2 & r_3 & t_1 \\ r_4 & r_5 & r_6 & t_2 \\ r_7 & r_8 & r_9 & t_3 \end{bmatrix}$$

intrinsic
parameters

extrinsic
parameters

$$\mathbf{R} = \begin{bmatrix} r_1 & r_2 & r_3 \\ r_4 & r_5 & r_6 \\ r_7 & r_8 & r_9 \end{bmatrix} \quad \mathbf{t} = \begin{bmatrix} t_1 \\ t_2 \\ t_3 \end{bmatrix}$$

3D rotation

3D translation

More general camera matrices

Non-square pixels, sensor may be skewed
(causing focal length to be different along x and y).

$$\mathbf{P} = \begin{bmatrix} \alpha_x & s & p_x \\ 0 & \alpha_y & p_y \\ 0 & 0 & 1 \end{bmatrix} \left[\mathbf{R} \mid -\mathbf{RC} \right]$$

Q. How many degrees of freedom?

Camera Models: Still an Active Area

Is everybody only using a 2400 years old model?

- More complex cameras: pinhole + distortion, fisheye, catadioptric, dashcams, underwater...
- [The Double Sphere Camera Model](#), Usenko *et al* ECCV 2018 (commonly used in robotics, like in our [ICRA'22 paper](#))
- Learning Camera Models:
[Neural Ray Surfaces](#),
Vasiljevic *et al*, 3DV 2022

(a) Pinhole (KITTI)

(b) Catadioptric (OmniCam)
