Hierarchical Modeling

Reading

Required:

• Angel, sections 10.1 – 10.6, 10.8

Optional:

• OpenGL Programming Guide, chapter 3

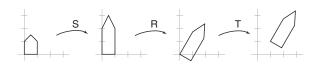

1

Symbols and instances

Most graphics APIs support a few geometric **primitives**:

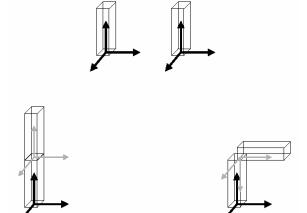

- spheres
- cubes
- cylinders

These symbols are **instanced** using an **instance transformation**.

Q: What is the matrix for the instance transformation above?

Connecting primitives

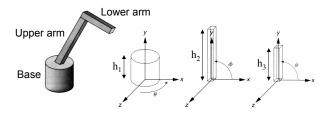

2

3D Example: A robot arm

Consider this robot arm with 3 degrees of freedom:

- Base rotates about its vertical axis by θ
- Upper arm rotates in its xy-plane by ∮
- Lower arm rotates in its xy-plane by ψ

Q: What matrix do we use to transform the base?

Q: What matrix for the upper arm?

Q: What matrix for the lower arm?

5

Robot arm implementation

The robot arm can be displayed by keeping a global matrix and computing it at each step:

Do the matrix computations seem wasteful?

6

Robot arm implementation, better

Instead of recalculating the global matrix each time, we can just update it *in place* by concatenating matrices on the right:

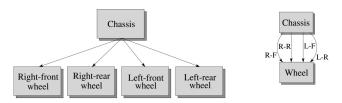

Robot arm implementation, OpenGL

OpenGL maintains a global state matrix called the **model-view matrix**, which is updated by concatenating matrices on the *right*.

```
main()
{
    glMatrixMode( GL_MODELVIEW );
    glLoadIdentity();
    robot_arm();
}
robot_arm()
    glRotatef( theta, 0.0, 1.0, 0.0 );
   base();
    glTranslatef( 0.0, h1, 0.0 );
    glRotatef( phi, 0.0, 0.0, 1.0 );
    upper_arm();
    glTranslatef( 0.0, h2, 0.0 );
    glRotatef( psi, 0.0, 0.0, 1.0 );
    lower_arm();
}
```

Hierarchical modeling

Hierarchical models can be composed of instances using trees or DAGs:

- edges contain geometric transformations
- nodes contain geometry (and possibly drawing attributes)

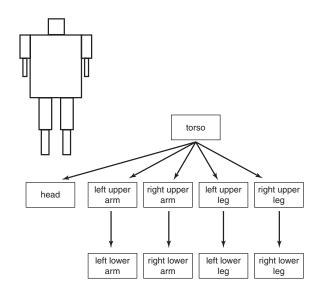

How might we draw the tree for the robot arm?

9

Human figure implementation, OpenGL

```
figure()
    torso();
    glPushMatrix();
        glTranslate( ... );
        glRotate( ... );
        head();
    glPopMatrix();
    glPushMatrix();
        glTranslate( ... );
        glRotate( ... );
        left_upper_arm();
        glPushMatrix();
            glTranslate( ... );
            glRotate( ... );
            left_lower_arm();
        glPopMatrix();
     glPopMatrix();
}
```

A complex example: human figure

Q: What's the most sensible way to traverse this tree?

10

Animation

The above examples are called **articulated models**:

- · rigid parts
- · connected by joints

They can be animated by specifying the joint angles (or other display parameters) as functions of time.

11

12

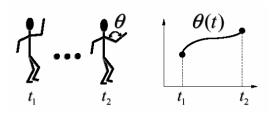

Key-frame animation

The most common method for character animation in production is **key-frame animation**.

- Each joint specified at various key frames (not necessarily the same as other joints)
- System does interpolation or in-betweening

Doing this well requires:

- A way of smoothly interpolating key frames: splines
- A good interactive system
- A lot of skill on the part of the animator

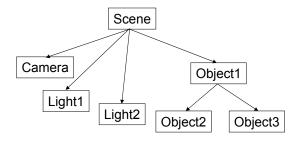

13

Scene graphs

The idea of hierarchical modeling can be extended to an entire scene, encompassing:

- · many different objects
- lights
- · camera position

This is called a scene tree or scene graph.

14

Summary

Here's what you should take home from this lecture:

- All the boldfaced terms.
- How primitives can be instanced and composed to create hierarchical models using geometric transforms.
- How the notion of a model tree or DAG can be extended to entire scenes.
- How OpenGL transformations can be used in hierarchical modeling.
- How keyframe animation works.
