# Texture mapping

*Texture mapping (Woo et al., fig. 9-1)*

Texture mapping allows you to take a simple polygon and give it the appearance of something much more complex.

- ◆ Due to Ed Catmull, PhD thesis, 1974
- ◆ Refined by Blinn & Newell, 1976

A texture can modulate just about any parameter  
– diffuse color, specular color, specular exponent,  
...

# Implementing texture mapping

A texture lives in its own abstract image coordinates parameterized by  $(u, v)$  in the range  $([0..1], [0..1])$ :

It can be wrapped around many different surfaces:

*barycentric  
coords  $(\alpha, \beta, \gamma)$*

$$P = \alpha A + \beta B + \gamma C$$

With a ray caster, we can do the sphere and cylinder mappings directly (as we will see later). For graphics hardware, everything gets converted to a triangle mesh with associated  $(u, v)$  coordinates.

$$(u_p, v_p) = \alpha (u_A, v_A) + \beta (u_B, v_B) + \gamma (u_C, v_C)$$

Note: if the surface moves/deforms, the texture goes with it.

# Texture coordinates on a surface of revolution

Recall that for a surface of revolution, we have:

**Profile curve:**  $C[j]$  where  $j \in [0..M-1]$

**Rotation angles:**  $\theta[i] = 2\pi i/N$  where  $i \in [0..N]$

The simplest assignment of texture coordinates would be:

$$u = \frac{i}{N} \quad v = \frac{j}{M-1}$$

Note that you should include the rotation angles for  $i=0$  and  $i=N$ , even though they produce the same points (after rotating by 0 and  $2\pi$ ). Why do this??

## Texture coordinates on a surface of revolution

If we wrap an image around this surface of revolution, what artifacts would we expect to see?

We can reduce distortion in  $v$ . Define:

$$d[j] = \begin{cases} \|C[j] - C[j-1]\|, & \text{if } j \neq 0 \\ 0, & \text{if } j = 0 \end{cases}$$

and set  $v$  to fractional distance along the curve:

$$v = \frac{\sum_{k=0}^j d[k]}{\sum_{k=0}^{m-1} d[k]} \leftarrow$$

**You must do this for  $v$  for the programming assignment!**  $\leftarrow$

## Mapping to texture image coords

The texture is usually stored as an image. Thus, we need to convert from abstract texture coordinate:

$$(u, v) \text{ in the range } ([0..1], [0..1])$$

to texture image coordinates:

$$(u_{tex}, v_{tex}) \text{ in the range } ([0.. w_{tex}], [0.. h_{tex}])$$

Point on triangle mesh

Mapping to abstract texture coords

Mapping to texture pixel coords

*Nearest neighbor interpolation ick!*

**Q:** What do you do when the texture sample you need lands between texture pixels?

# Texture resampling

We need to resample the texture:

$$\Delta_x, \Delta_y \in [0, 1]$$

Thus, we seek to solve for:  $T(\underline{a}, \underline{b}) = T(\underline{i + \Delta_x}, \underline{j + \Delta_y})$

A common choice is **bilinear interpolation**:

$$T(i + \Delta_x, j) = \underline{(1 - \Delta_x)} T[i, j] + \underline{\Delta_x} T[i + 1, j]$$

$$T(\underline{i + \Delta_x}, j + 1) = \underline{(1 - \Delta_x)} T[i, j + 1] + \underline{\Delta_x} T[i + 1, j + 1]$$

$$T(\underline{i + \Delta_x}, \underline{j + \Delta_y}) = \underline{(1 - \Delta_y)} T(i + \Delta_x, j) + \underline{\Delta_y} T(i + \Delta_x, j + 1)$$

$$= \underline{(1 - \Delta_x)(1 - \Delta_y)} T[i, j] + \underline{\Delta_x (1 - \Delta_y)} T[i + 1, j] +$$

$$\underline{(1 - \Delta_x) \Delta_y} T[i, j + 1] + \underline{\Delta_x \Delta_y} T[i + 1, j + 1]$$

# Texture mapping and rasterization

Texture-mapping can also be handled in rasterization algorithms.

## Method:

- ◆ Scan conversion is done in screen space, as usual
- ◆ Each pixel is colored according to the texture
- ◆ Texture coordinates are found by Gouraud-style interpolation

Note: Mapping is more complicated to handle perspective correctly.

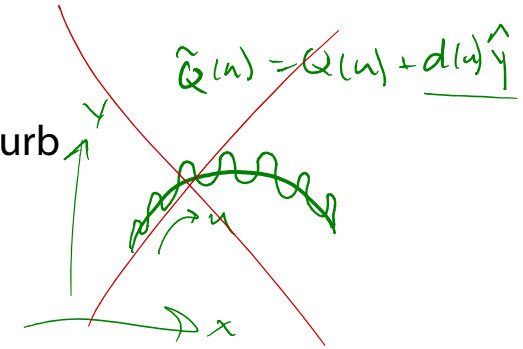

# Displacement mapping

Textures can be used for more than just color.

In **displacement mapping**, a texture is used to perturb the surface geometry itself. Here's the idea in 2D:

$$\tilde{Q}(u) = Q(u) + d(u)\underline{N}(u)$$

- ◆ These displacements “animate” with the surface
- ◆ In 3D, you would of course have  $(u, v)$  parameters instead of just  $u$ .

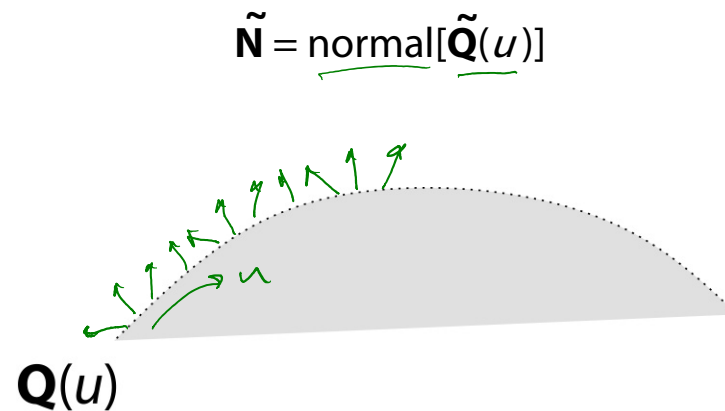

Suppose  $Q$  is a simple surface, like a cube. Will it take more work to render the modified surface  $\tilde{Q}$ ?

Yes - more geometry

# Bump mapping

In **bump mapping**, a texture is used to perturb the normal:

- ◆ Use the original, simpler geometry,  $\mathbf{Q}(u)$ , for hidden surfaces
- ◆ Use the normal from the displacement map for shading:

What artifacts in the images would reveal that bump mapping is fake?

These will be wrong  $\Rightarrow$

silhouettes  
occlusions

shadows - onto other surfaces or itself

# Displacement vs. bump mapping

Input texture

Rendered as displacement map over a rectangular surface

## Displacement vs. bump mapping (cont'd)

Original rendering

Rendering with bump map  
wrapped around a cylinder

*Bump map and rendering by Wyvern Aldinger*

## Solid textures

Q: What kinds of artifacts might you see from using a marble veneer instead of real marble?

*Seam where texture boundaries meet*

*distortion*

One solution is to use **solid textures**:

- ◆ Use model-space coordinates to index into a 3D texture
- ◆ Like “carving” the object from the material

One difficulty of solid texturing is coming up with the textures.

## Solid textures (cont'd)

Here's an example for a vase cut from a solid marble texture:

*Solid marble texture by Ken Perlin, (Foley, IV-21)*

## Solid textures (cont'd)

$$\text{in}(x, y, z) = \text{stripes}(x)$$

$$\text{shift}(x, y, z) = K \cdot \text{noise}(x, y, z)$$

$$\text{out}(x, y, z) = \text{stripes}(x + \text{shift}(x, y, z))$$

# Environment mapping

In **environment mapping** (also known as **reflection mapping**), a texture is used to model an object's environment:

- ◆ Rays are bounced off objects into environment
- ◆ Color of the environment used to determine color of the illumination
- ◆ Environment mapping works well when there is just a single object – or in conjunction with ray tracing

This can be readily implemented (without interreflection) in graphics hardware using a fragment shader, where the texture is stored in a “cube map” instead of a sphere.

With a ray tracer, the concept is easily extended to handle refraction as well as reflection (and interreflection).

## Summary

What to take home from this lecture:

1. The meaning of the boldfaced terms.
2. Familiarity with the various kinds of texture mapping, including their strengths and limitations.
