Texture mapping

Texture mapping (Woo et al., fig. 9-1)

Texture mapping allows you to take a simple polygon and give it the appearance of something much more complex.

- Due to Ed Catmull, PhD thesis, 1974
- Refined by Blinn & Newell, 1976

A texture can modulate just about any parameter – diffuse color, specular color, specular exponent, …
Implementing texture mapping

A texture lives in its own abstract image coordinates parameterized by \((u, v)\) in the range \([0..1], [0..1]\):

It can be wrapped around many different surfaces:

With a ray caster, we can do the sphere and cylinder mappings directly (as we will see later). For graphics hardware, everything gets converted to a triangle mesh with associated \((u, v)\) coordinates.

Note: if the surface moves/deforms, the texture goes with it.
Texture coordinates on a surface of revolution

Recall that for a surface of revolution, we have:

**Profile curve**: $C[j]$ where $j \in [0..M-1]$

**Rotation angles**: $\theta[i] = \frac{2\pi i}{N}$ where $i \in [0..N]$

The simplest assignment of texture coordinates would be:

$\mathbf{u} = \frac{i}{N}$

Note that you should include the rotation angles for $i=0$ and $i=N$, even though they produce the same points (after rotating by 0 and $2\pi$). Why do this??
Texture coordinates on a surface of revolution

If we wrap an image around this surface of revolution, what artifacts would we expect to see?

We can reduce distortion in $\nu$. Define:

$$d[j] = \begin{cases} 
  \|C[j] - C[j-1]\|, & \text{if } j \neq 0 \\
  0, & \text{if } j = 0
\end{cases}$$

and set $\nu$ to fractional distance along the curve:

$$\nu = \frac{1}{2} \sum_{k=0}^{M-1} d[k] \sqrt{\sum_{k=0}^{M-1} d[k]}$$

You must do this for $\nu$ for the programming assignment!
Mapping to texture image coords

The texture is usually stored as an image. Thus, we need to convert from abstract texture coordinate:

\[(u, v)\] in the range \([0..1], [0..1]\)

to texture image coordinates:

\[(u_{\text{tex}}, v_{\text{tex}})\] in the range \([0..w_{\text{tex}}], [0..h_{\text{tex}}]\)

Q: What do you do when the texture sample you need lands between texture pixels?
Texture resampling

We need to resample the texture:

Thus, we seek to solve for: $T(a,b) = T(i + \Delta_x, j + \Delta_y)$

A common choice is **bilinear interpolation**:

$T(i + \Delta_x, j) = (1 - \Delta_x)T[i, j] + \Delta_x T[i + 1, j]$

$T(i + \Delta_x, j + 1) = (1 - \Delta_x)T[i, j + 1] + \Delta_x T[i + 1, j + 1]$

$T(i + \Delta_x, j + \Delta_y) = (1 - \Delta_y)T(i + \Delta_x, j) + \Delta_y T(i + \Delta_x, j + 1)$

$= (1 - \Delta_x)(1 - \Delta_y)[i, j] + \Delta_x (1 - \Delta_y)T[i + 1, j] + (1 - \Delta_x)\Delta_y T[i, j + 1] + \Delta_x \Delta_y T[i + 1, j + 1]$
Texture mapping and rasterization

Texture-mapping can also be handled in rasterization algorithms.

**Method:**
- Scan conversion is done in screen space, as usual
- Each pixel is colored according to the texture
- Texture coordinates are found by Gouraud-style interpolation

**Note:** Mapping is more complicated to handle perspective correctly.
Displacement mapping

Textures can be used for more than just color.

In **displacement mapping**, a texture is used to perturb the surface geometry itself. Here’s the idea in 2D:

\[ \tilde{Q}(u) = Q(u) + d(u)N(u) \]

- These displacements “animate” with the surface
- In 3D, you would of course have \((u, v)\) parameters instead of just \(u\).

Suppose \(Q\) is a simple surface, like a cube. Will it take more work to render the modified surface \(\tilde{Q}\)?

\[ \text{Yes - more geometry} \]
**Bump mapping**

In **bump mapping**, a texture is used to perturb the normal:

- Use the original, simpler geometry, $\mathbf{Q}(u)$, for hidden surfaces
- Use the normal from the displacement map for shading:

$$\hat{\mathbf{N}} = \text{normal}[\tilde{\mathbf{Q}}(u)]$$

What artifacts in the images would reveal that bump mapping is fake?

- Silhouettes
- Shadows onto other surfaces or itself
- Occlusions

These will be wrong
Displacement vs. bump mapping

Input texture

Rendered as displacement map over a rectangular surface

*Bump map and rendering by Wyvern Aldinger*
**Solid textures**

**Q:** What kinds of artifacts might you see from using a marble veneer instead of real marble?

One solution is to use **solid textures**:

- Use model-space coordinates to index into a 3D texture
- Like “carving” the object from the material

One difficulty of solid texturing is coming up with the textures.
Solid textures (cont'd)

Here's an example for a vase cut from a solid marble texture:

Solid marble texture by Ken Perlin, (Foley, IV-21)
**Solid textures (cont'd)**

\[
in(x, y, z) = \text{stripes}(x) \\
\text{shift}(x, y, z) = K \cdot \text{noise}(x, y, z) \\
\text{out}(x, y, z) = \text{stripes}(x + \text{shift}(x, y, z))
\]
Environment mapping

In environment mapping (also known as reflection mapping), a texture is used to model an object's environment:

- Rays are bounced off objects into environment
- Color of the environment used to determine color of the illumination
- Environment mapping works well when there is just a single object – or in conjunction with ray tracing

This can be readily implemented (without interreflection) in graphics hardware using a fragment shader, where the texture is stored in a “cube map” instead of a sphere.

With a ray tracer, the concept is easily extended to handle refraction as well as reflection (and interreflection).
Summary

What to take home from this lecture:

1. The meaning of the boldfaced terms.

2. Familiarity with the various kinds of texture mapping, including their strengths and limitations.
