Texture mapping

Texture mapping (Woo et al., fig. 9-1)

Texture mapping allows you to take a simple polygon and give it the appearance of something much more complex.

- Due to Ed Catmull, PhD thesis, 1974
- Refined by Blinn & Newell, 1976

A texture can modulate just about any parameter – diffuse color, specular color, specular exponent, …
Implementing texture mapping

A texture lives in its own abstract image coordinates parameterized by \((u, v)\) in the range \([0..1], [0..1]\):

It can be wrapped around many different surfaces:

With a ray caster, we can do the sphere and cylinder mappings directly (as we will see later). For graphics hardware, everything gets converted to a triangle mesh with associated \((u, v)\) coordinates.

Note: if the surface moves/deforms, the texture goes with it.
Texture coordinates on a surface of revolution

Recall that for a surface of revolution, we have:

**Profile curve**: \( C[j] \) where \( j \in [0..M-1] \)

**Rotation angles**: \( \theta[i] = \frac{2\pi i}{N} \) where \( i \in [0..N] \)

The simplest assignment of texture coordinates would be:

\[
\begin{align*}
\mathbf{u} &= \frac{i}{N} \\
\mathbf{v} &= \frac{j}{M-1}
\end{align*}
\]

Note that you should include the rotation angles for \( i = 0 \) and \( i = N \), even though they produce the same points (after rotating by 0 and \( 2\pi \)). Why do this??
Texture coordinates on a surface of revolution

If we wrap an image around this surface of revolution, what artifacts would we expect to see?

We can reduce distortion in $\nu$. Define:

$$d[j] = \begin{cases} ||c[j] - c[j-1]||, & \text{if } j \neq 0 \\ 0, & \text{if } j = 0 \end{cases}$$

and set $\nu$ to fractional distance along the curve:

$$\nu = \frac{1}{2} \sum_{k=0}^{M-1} d[k] \sqrt{2} \sum_{k=0}^{M-1} d[k]$$

You must do this for $\nu$ for the programming assignment!
Mapping to texture image coords

The texture is usually stored as an image. Thus, we need to convert from abstract texture coordinate:

$$(u, v) \text{ in the range } ([0..1], [0..1])$$

to texture image coordinates:

$$(u_{\text{tex}}, v_{\text{tex}}) \text{ in the range } ([0..w_{\text{tex}}], [0..h_{\text{tex}}])$$

**Q:** What do you do when the texture sample you need lands between texture pixels?
Texture resampling

We need to resample the texture:

Thus, we seek to solve for: \( T(a, b) = T(i + \Delta_x, j + \Delta_y) \)

A common choice is **bilinear interpolation**:

\[
T(i + \Delta_x, j) = (1 - \Delta_x)T[i, j] + \Delta_xT[i + 1, j]
\]

\[
T(i + \Delta_x, j + 1) = (1 - \Delta_x)T[i, j + 1] + \Delta_xT[i + 1, j + 1]
\]

\[
T(i + \Delta_x, j + \Delta_y) = (1 - \Delta_y)T(i + \Delta_x, j) + \Delta_yT(i + \Delta_x, j + 1)
\]

\[
= (1 - \Delta_x)(1 - \Delta_y)[i, j] + \Delta_x(1 - \Delta_y)T[i + 1, j] + \Delta_x\Delta_yT[i + 1, j + 1]
\]
Texture mapping and rasterization

Texture-mapping can also be handled in rasterization algorithms.

**Method:**

- Scan conversion is done in screen space, as usual
- Each pixel is colored according to the texture
- Texture coordinates are found by Gouraud-style interpolation

**Note:** Mapping is more complicated to handle perspective correctly.
Displacement mapping

Textures can be used for more than just color.

In **displacement mapping**, a texture is used to perturb the surface geometry itself. Here’s the idea in 2D:

- These displacements “animate” with the surface
- In 3D, you would of course have \( (u, v) \) parameters instead of just \( u \).

Suppose \( \mathbf{Q} \) is a simple surface, like a cube. Will it take more work to render the modified surface \( \tilde{\mathbf{Q}} \)?
**Bump mapping**

In **bump mapping**, a texture is used to perturb the normal:

- Use the original, simpler geometry, \( Q(u) \), for hidden surfaces
- Use the normal from the displacement map for shading:

\[
\tilde{N} = \text{normal}[\tilde{Q}(u)]
\]

What artifacts in the images would reveal that bump mapping is fake?

- Silhouettes
- Shadows onto other surfaces or itself
- Occlusions

These will be wrong
Displacement vs. bump mapping

Input texture

*Bump map and rendering by Wyvern Aldinger*
Solid textures

**Q:** What kinds of artifacts might you see from using a marble veneer instead of real marble?

One solution is to use **solid textures:**

- Use model-space coordinates to index into a 3D texture
- Like “carving” the object from the material

One difficulty of solid texturing is coming up with the textures.
Solid textures (cont'd)

Here's an example for a vase cut from a solid marble texture:

*Solid marble texture by Ken Perlin, (Foley, IV-21)*
Solid textures (cont'd)

\[ \text{in}(x, y, z) = \text{stripes}(x) \]

\[ \text{shift}(x, y, z) = K \cdot \text{noise}(x, y, z) \]

\[ \text{out}(x, y, z) = \text{stripes}(x + \text{shift}(x, y, z)) \]
Environment mapping

In **environment mapping** (also known as **reflection mapping**), a texture is used to model an object's environment:

- Rays are bounced off objects into environment
- Color of the environment used to determine color of the illumination
- Environment mapping works well when there is just a single object – or in conjunction with ray tracing

This can be readily implemented (without interreflection) in graphics hardware using a fragment shader, where the texture is stored in a “cube map” instead of a sphere.

With a ray tracer, the concept is easily extended to handle refraction as well as reflection (and interreflection).
Summary

What to take home from this lecture:

1. The meaning of the boldfaced terms.

2. Familiarity with the various kinds of texture mapping, including their strengths and limitations.
