# **Texture Mapping**

Zoran Popovic CSE 457 Winter 2021

## Reading

#### Optional

- Angel and Shreiner: 7.4-7.10
- Marschner and Shirley: 11.1-11.2.3, 11.2.5, 11.4-11.5

#### Further reading

- Paul S. Heckbert. Survey of texture mapping. IEEE Computer Graphics and Applications 6(11): 56--67, November 1986.
- Woo, Neider, & Davis, Chapter 9
- James F. Blinn and Martin E. Newell. Texture and reflection in computer generated images. **Communications of the ACM** 19(10): 542--547, October 1976.

### **Texture mapping**

Texture mapping (Woo et al., fig. 9-1)

Texture mapping allows you to take a simple polygon and give it the appearance of something much more complex.

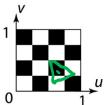

- ◆ Due to Ed Catmull, PhD thesis, 1974
- Refined by Blinn & Newell, 1976

A texture can modulate just about any parameter – diffuse color, specular color, specular exponent,

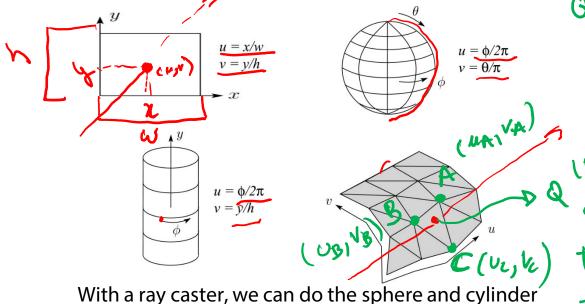

. . .

## Implementing texture mapping

A texture lives in it own abstract image coordinates paramaterized by (u, v) in the range ([0..1], [0..1]):

It can be wrapped around many different surfaces:

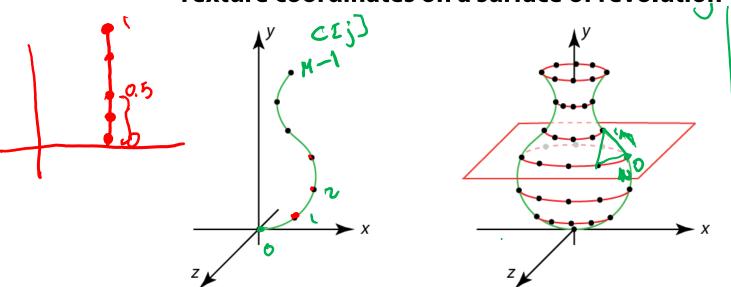

With a ray caster, we can do the sphere and cylinder mappings directly (as we will see later). For graphics hardware, everything gets converted to a triangle mesh with associated (u, v) coordinates.

Note: if the surface moves/deforms, the texture goes with it.

Q= 2 A+ PB+TC

, Q 2 (Ne, Va) 1 + B(Mb1 Vb) + (8 (Mc Vi) Texture coordinates on a surface of revolution

Recall that for a surface of revolution, we have:

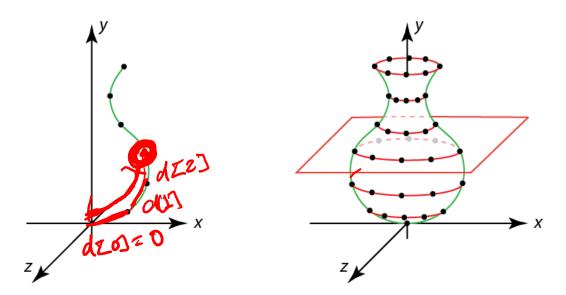

**Profile curve**: C[j] where  $j \in [0..M-1]$ 

**Rotation angles**:  $\theta[i] = 2\pi i / N$  where  $i \in [0..N]$ 

The simplest assignment of texture coordinates would be:

Note that you should include the rotation angles for i = 0 and i = N, even though they produce the same points (after rotating by 0 and  $2\pi$ ). Why do this??

#### Texture coordinates on a surface of revolution

If we wrap an image around this surface of revolution, what artifacts would we expect to see?

We can reduce distortion in v. Define:

$$d[j] = \begin{cases} ||C[j] - C[j-1]||, & \text{if } j \neq 0 \\ 0, & \text{if } j = 0 \end{cases}$$

and set v to fractional distance along the curve:  $\sqrt{z} \qquad \sum_{k=0}^{\infty} d[k] / \sum_{k=0}^{\infty} d[k]$ 

You must do this for v for the programming assignment!

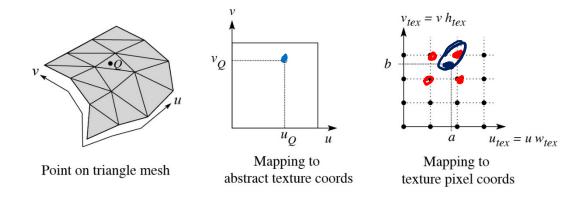

## Mapping to texture image coords

The texture is usually stored as an image. Thus, we need to convert from abstract texture coordinate:

$$(u, v)$$
 in the range ([0..1], [0..1])

to texture image coordinates:

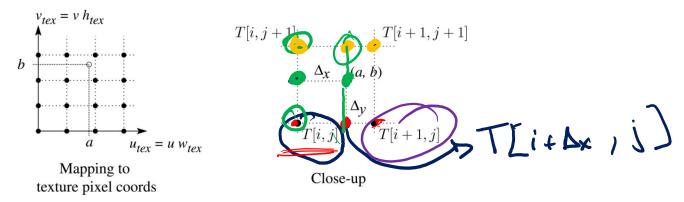

$$(u_{tex}, v_{tex})$$
 in the range  $([0...w_{tex}], [0...h_{tex}])$ 

**Q**: What do you do when the texture sample you need lands between texture pixels?

## **Texture resampling**

We need to resample the texture:

Thus, we seek to solve for:  $T(a,b) = T(i + \Delta_x, j + \Delta_y)$ 

A common choice is **bilinear interpolation**:

$$T(i+\Delta_{x},j) = \underbrace{\left( \begin{array}{c} & & \\ & & \\ \end{array} \right)}_{T[i,j]} + \underbrace{\begin{array}{c} & & \\ & & \\ \end{array} \right)}_{T[i+1,j]}$$

$$T(i+\Delta_{x},j+1) = \underbrace{\left( \begin{array}{c} & & \\ & & \\ \end{array} \right)}_{T[i,j+1]} + \underbrace{\begin{array}{c} & & \\ & & \\ \end{array} \right)}_{T[i+1,j+1]}$$

$$T(i+\Delta_{x},j+\Delta_{y}) = \underbrace{\begin{pmatrix} & & \\ & & \\ \end{array} \right)}_{T[i+\Delta_{x},j)} + \underbrace{\begin{array}{c} & & \\ & & \\ \end{array} \right)}_{T[i+1,j]} + \underbrace{\begin{array}{c} & & \\ & & \\ \end{array} \right)}_{T[i+1,j+1]}$$

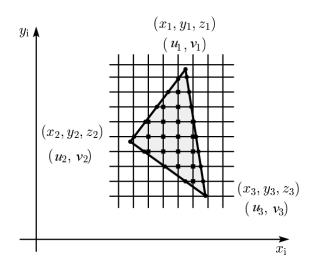

$$= \underbrace{\begin{pmatrix} & & \\ & & \\ \end{array} \right)}_{T[i,j+1]} + \underbrace{\begin{array}{c} & & \\ & & \\ \end{array} \right)}_{T[i+1,j+1]}$$

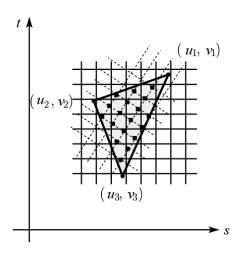

## **Texture mapping and rasterization**

Texture-mapping can also be handled in rasterization algorithms.

#### Method:

- Scan conversion is done in screen space, as usual
- Each pixel is colored according to the texture
- Texture coordinates are found by Gouraud-style interpolation

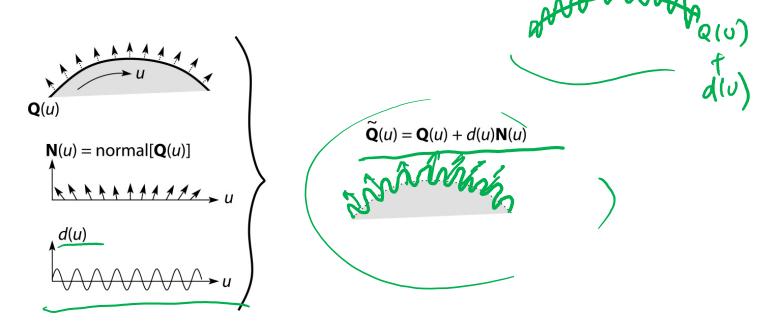

<u>Note</u>: Mapping is more complicated to handle perspective correctly.

## **Displacement mapping**

Textures can be used for more than just color.

In **displacement mapping**, a texture is used to perturb the surface geometry itself. Here's the idea in 2D:

- These displacements "animate" with the surface
- ◆ In 3D, you would of course have (*u*, *v*) parameters instead of just *u*.

Suppose Q is a simple surface, like a cube. Will it take more work to render the modified surface  $\widetilde{Q}$ ?

## **Bump and normal mapping**

In **bump mapping**, a texture is used to perturb the normal:

- ◆ Use the original, simpler geometry, **Q**(*u*), for hidden surfaces
- Use the normal from the displacement map for shading:

$$\tilde{\mathbf{N}} = \operatorname{normal}[\tilde{\mathbf{Q}}(u)]$$

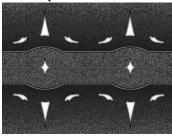

An alternative is to compute the normals from the original bump map height field and map them over the smooth surface. This is called **normal mapping**.

 $\mathbf{Q}(u)$ 

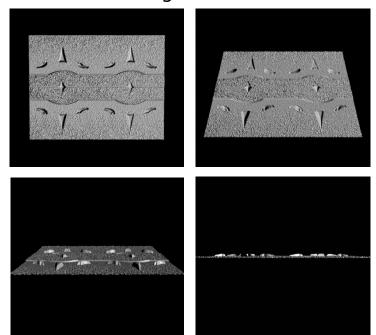

What artifacts in the images would reveal that bump (or normal) mapping is fake?

## Displacement vs. bump mapping

Input texture

Rendered as displacement map over a rectangular surface

## **Displacement vs. bump mapping (cont'd)**

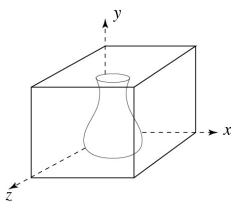

Original rendering

Rendering with bump map wrapped around a cylinder

Bump map and rendering by Wyvern Aldinger

#### **Solid textures**

**Q**: What kinds of artifacts might you see from using a marble veneer instead of real marble?

One solution is to use **solid textures**:

- Use model-space coordinates to index into a 3D texture
- Like "carving" the object from the material

One difficulty of solid texturing is coming up with the textures.

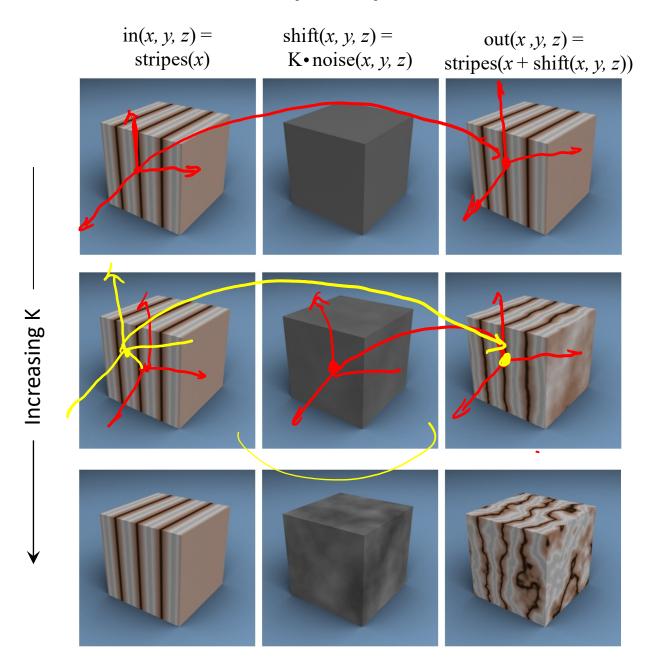

## **Solid textures (cont'd)**

Here's an example for a vase cut from a solid marble texture:

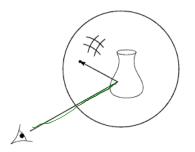

Solid marble texture by Ken Perlin, (Foley, IV-21)

## **Solid textures (cont'd)**

## **Environment mapping**

In **environment mapping** (also known as **reflection mapping**), a texture is used to model an object's environment:

- Rays are bounced off objects into environment
- Color of the environment used to determine color of the illumination
- Environment mapping works well when there is just a single object – or in conjunction with ray tracing

This can be readily implemented (without interreflection) in graphics hardware using a fragment shader, where the texture is stored in a "cube map" instead of a sphere.

With a ray tracer, the concept is easily extended to handle refraction as well as reflection (and interreflection).

## **Summary**

What to take home from this lecture:

- 1. The meaning of the boldfaced terms.
- 2. Familiarity with the various kinds of texture mapping, including their strengths and limitations.
