

CSE/EE 461 – Lecture 2

Protocols and Layering

Last Time ...

- Networks are used to share distributed resources
 - Key problems revolve around effective resource sharing
- Statistical multiplexing
 - It's well-suited to data communications

This Lecture

1. A top-down look at the Internet
2. Mechanics of protocols and layering
3. The OSI/Internet models

CSE 461

L2.3

1. A Brief Tour of the Internet

- What happens when you “click” on a web link?

- This is the view from 10,000 ft ...

CSE 461

L2.4

9,000 ft: Scalability

- Caching improves scalability

- We cut down on transfers:
 - Check cache (local or proxy) for a copy
 - Check with server for a new version

CSE 461

L2.5

8,000 ft: Naming (DNS)

- Map domain names to IP network addresses

- All messages are sent using IP addresses
 - So we have to translate names to addresses first
 - But we cache translations to avoid next time

CSE 461

L2.6

7,000 ft: Sessions (HTTP)

- A single web page can be multiple “objects”

- Fetch each “object”
 - either sequentially or in parallel

CSE 461

L2.7

6,000 ft: Reliability (TCP)

- Messages can get lost

- We acknowledge successful receipt and detect and retransmit lost messages (e.g., timeouts)

CSE 461

L2.8

5,000 ft: Congestion (TCP)

- Need to allocate bandwidth between users

- Senders balance available and required bandwidths by probing network path and observing the response

CSE 461

L2.9

4,000 ft: Packets (TCP/IP)

- Long messages are broken into packets
 - Maximum Ethernet packet is 1.5 Kbytes
 - Typical web page is 10 Kbytes

- Number the segments for reassembly

CSE 461

L2.10

3,000 ft: Routing (IP)

- Packets are directed through many routers

CSE 461

L2.11

2,000 ft: Multi-access (e.g., Cable)

- May need to share links with other senders

- Poll headend to receive a timeslot to send upstream
 - Headend controls all downstream transmissions
 - A lower level of addressing is used ...

CSE 461

L2.12

1,000 ft: Framing/Modulation

- Protect, delimit and modulate payload as a signal

Sync / Unique	Header	Payload w/ error correcting code
---------------	--------	----------------------------------

- E.g, for cable, take payload, add error protection (Reed-Solomon), header and framing, then turn into a signal
 - Modulate data to assigned channel and time (upstream)
 - Downstream, 6 MHz (~30 Mbps), Upstream ~2 MHz (~3 Mbps)

CSE 461

L2.13

2. Protocols and Layering

- We need abstractions to handle complexity
- A protocol is an agreement dictating the form and function of data exchanged between parties to effect communication
- Two parts:
 - Syntax: where the bits go
 - Semantics: what they mean, what to do with them
- Examples:
 - IP, the Internet protocol
 - TCP and HTTP, for the Web

CSE 461

L2.14

Protocol Standards

- Different functions require different protocols
- Thus there are many protocol standards
 - E.g., IP, TCP, UDP, HTTP, DNS, FTP, SMTP, NNTP, ARP, Ethernet/802.3, 802.11, RIP, OSPF, 802.1D, NFS, ICMP, IGMP, DVMRP, IPSEC, PIM-SM, BGP, ...
- Organizations: IETF, IEEE, ITU
- IETF (www.ietf.org) specifies Internet-related protocols
 - RFCs (Requests for Comments)
 - “We reject kings, presidents and voting. We believe in rough consensus and running code.” – Dave Clark.

CSE 461

L2.15

Layering and Protocol Stacks

- Layering is how we combine protocols
 - Higher level protocols build on services provided by lower levels
 - Peer layers communicate with each other

CSE 461

L2.16

Example – Layering at work

- We can connect different systems

CSE 461

L2.17

Layering Mechanics

- Encapsulation and decapsulation

CSE 461

L2.18

A Packet on the Wire

- Starts looking like an onion!

- This isn't entirely accurate
 - ignores segmentation and reassembly, Ethernet trailers, etc.
- But you can see that layering adds overhead

CSE 461

L2.19

More Layering Mechanics

- Multiplexing and demultiplexing in a protocol graph

CSE 461

L2.20

3. OSI/Internet Protocol Stacks

Key Question: What functionality goes in which protocol?

The “End to End Argument” (Reed, Saltzer, Clark, 1984):

- *Functionality should be implemented at a lower layer only if it can be correctly and completely implemented. (Sometimes an incomplete implementation can be useful as a performance optimization.)*
- Tends to push functions to the endpoints, which has aided the transparency and extensibility of the Internet.

CSE 461

L2.21

Internet Protocol Framework

CSE 461

L2.22

OSI “Seven Layer” Reference Model

- Seven Layers:

Application
Presentation
Session
Transport
Network
Link
Physical

Their functions:

- Your call
- Encode/decode messages
- Manage connections
- Reliability, congestion control
- Routing
- Framing, multiple access
- Symbol coding, modulation

CSE 461

L2.23

Key Concepts

- Protocol layers are the modularity that is used in networks to handle complexity
- The Internet/OSI models give us a roadmap of what kind of function belongs at what layer

CSE 461

L2.24
