

# **CSE/EE 461: Introduction to Computer Communications Networks Winter 2009**

## **Module 5**

### **IP/ICMP and the Network Layer**

**John Zahorjan  
zahorjan@cs.washington.edu  
534 Allen Center**

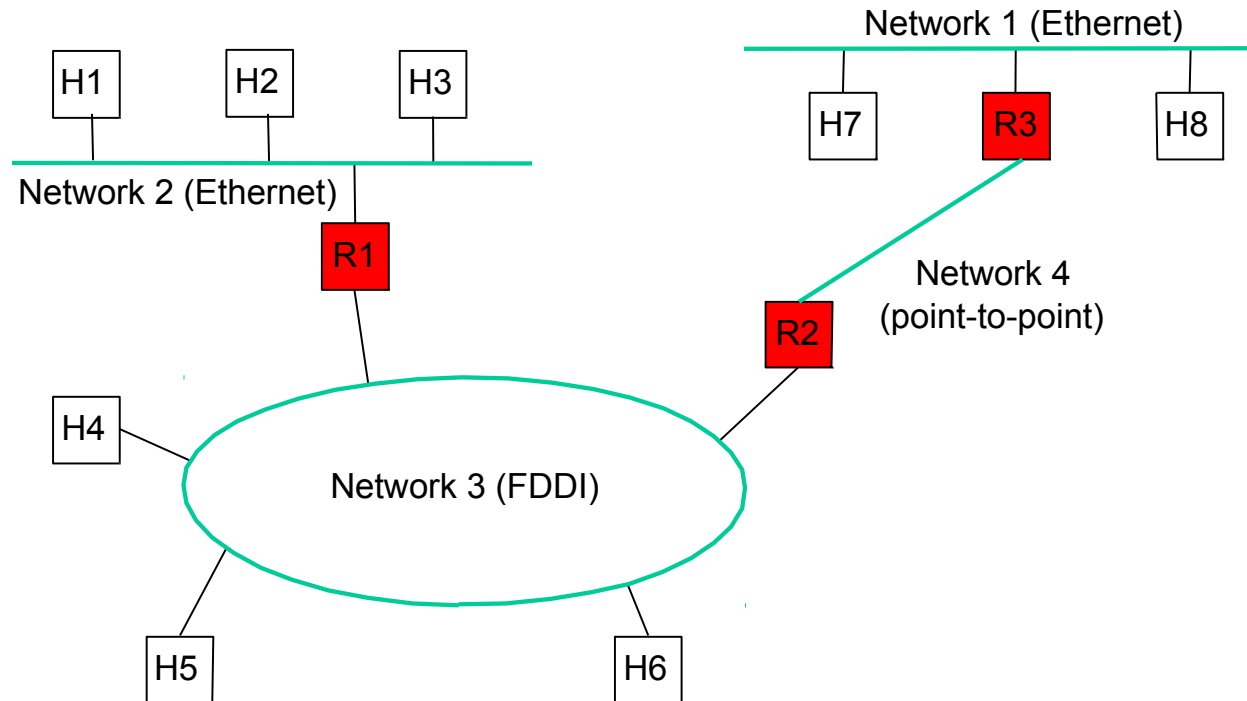

# Last Time

- Focus:
  - What to do when one shared LAN isn't big enough?
- Interconnecting LANs
  - Bridges and LAN switches
  - But there are limits ...

Application
Presentation
Session
Transport
Network
Data Link
Physical

# This Time: Internetworks

- Set of interconnected networks, e.g., the Internet
  - Scale and heterogeneity

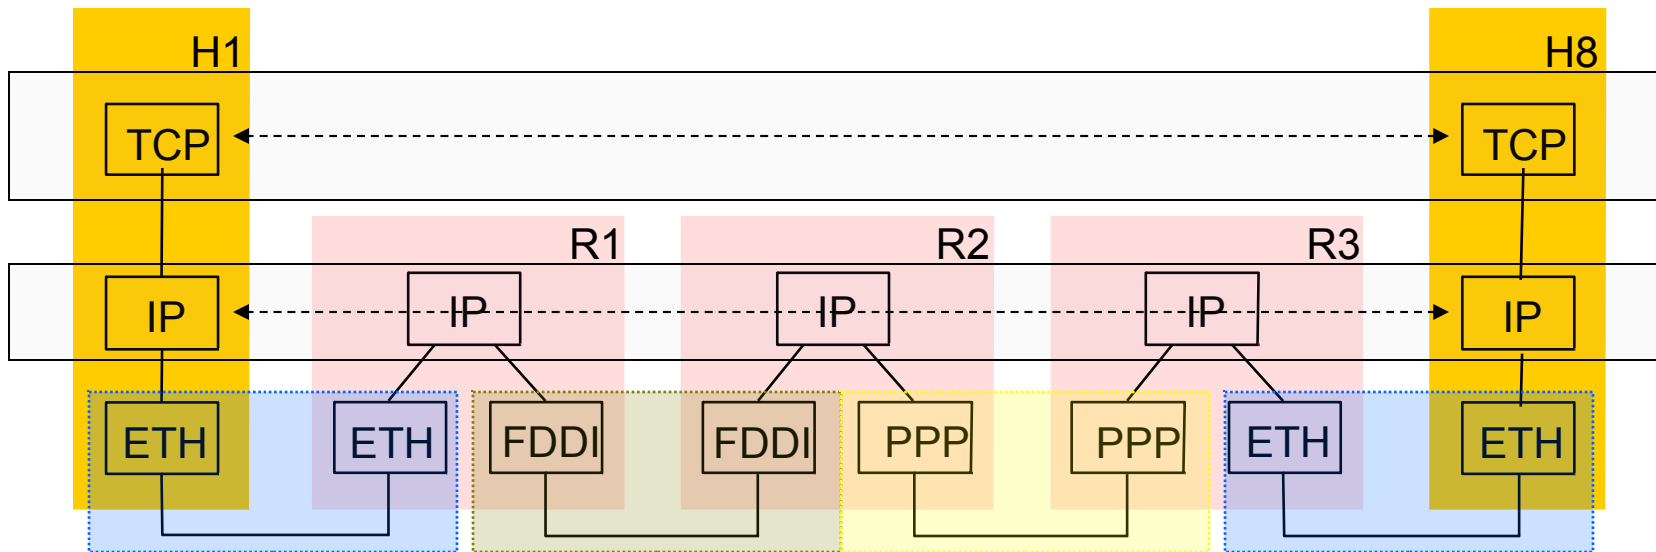

# The Protocol Stack

- Thinking about roles:
  - Transport: Process to Process
    - Example: TCP  
Reliable bytestream
  - Network: Host to Global Host
    - Example: IP  
Unreliable datagram
  - Data Link/Physical: Host to Local Host
    - Example: Ethernet  
Pretty reliable frame delivery

Network
Data Link
Physical

# As a picture

- **IP** is the network layer protocol used in the Internet
- Routers are **network** level gateways
- **Packet** is the term for network layer protocol data units (PDUs)

# Layers and Addressing

- Link layer address required to deliver along next hop
  - Example: 00:50:56:c0:00:01
- IP address required to deliver host-host
  - Example: 128.208.1.137
- Link layer addresses can be assigned (more or less) arbitrarily
  - Why?
- IP address assignment is more constrained
  - Why?

# Packet formats: encapsulation

- View of a packet on the (Ethernet) wires

- (In a pure world) Routers work with IP header, not higher
  - Higher would be a “layer violation”
- Routers strip and add link layer headers

# Network Layer Goals

- Run over heterogeneous Link/Physical layers
  - Motivates minimizing promises about the service
- Global delivery
  - Must be scalable
- Arbitrary Topology
  - Hard to get it wrong!
- Low overhead switching
  - Minimal processing of IP packet
    - E.g., don't have to rewrite IP header (much...)
- Network control / diagnosis
  - Routers have IP addresses, just like everyone else
    - Ping / traceroute

# Hop-by-Hop, not Paths

- Datagram delivery: postal service
  - connectionless, best-effort or unreliable service
  - Network can't guarantee delivery of the packet
  - Each packet from a host is routed independently
  - Example: IP
- Virtual circuit models: telephone
  - connection-oriented service
  - Signaling: connection establishment, data transfer, teardown
  - All packets from a host are routed the same way (router state)
  - Example: ATM, Frame Relay, X.25

# Internet Protocol (IP)

- IP (RFC791) defines a datagram “best effort” service
  - May be loss, reordering, duplication, and errors!
  - Currently IPv4 (IP version 4), IPv6 “on the way”
- Routers forward packets using periodically updated routes
  - Routing protocols (RIP, OSPF, BGP) run between routers to maintain routes (routing table, forwarding information base)
  - Over medium term, one path from host A to host B
- Global, hierarchical addresses, not flat addresses
  - 32 bits in IPv4 (128 bits in IPv6)
  - ARP (Address Resolution Protocol) maps IP to MAC addresses for final delivery

# The IP Narrow Waist

Model

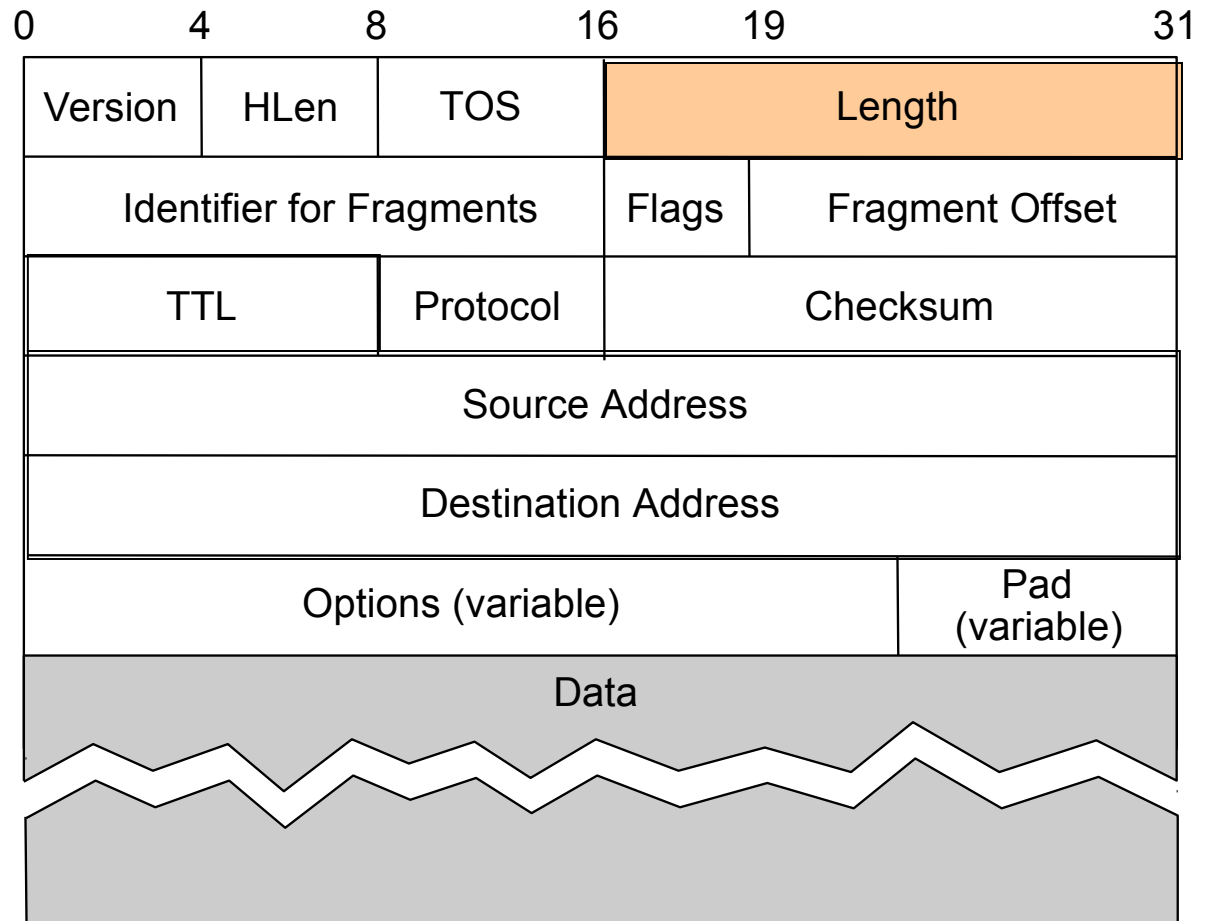

Protocols

The "narrow waist"

# IPv4 Header (and Select Fields)

- Length of packet
- Min 20 bytes, max 65K bytes (limit to packet size)

# Fragmentation: What, Why, and Why Not

- Different networks may have different frame limits (MTUs)
  - Ethernet 1.5KB, FDDI 4.5KB
- Don't know if packet will be too big for path beforehand
  - Could fragment on demand inside the network
    - IPv4
  - Could return an error to sending host
    - IPv6

# Fragmentation and Reassembly

---

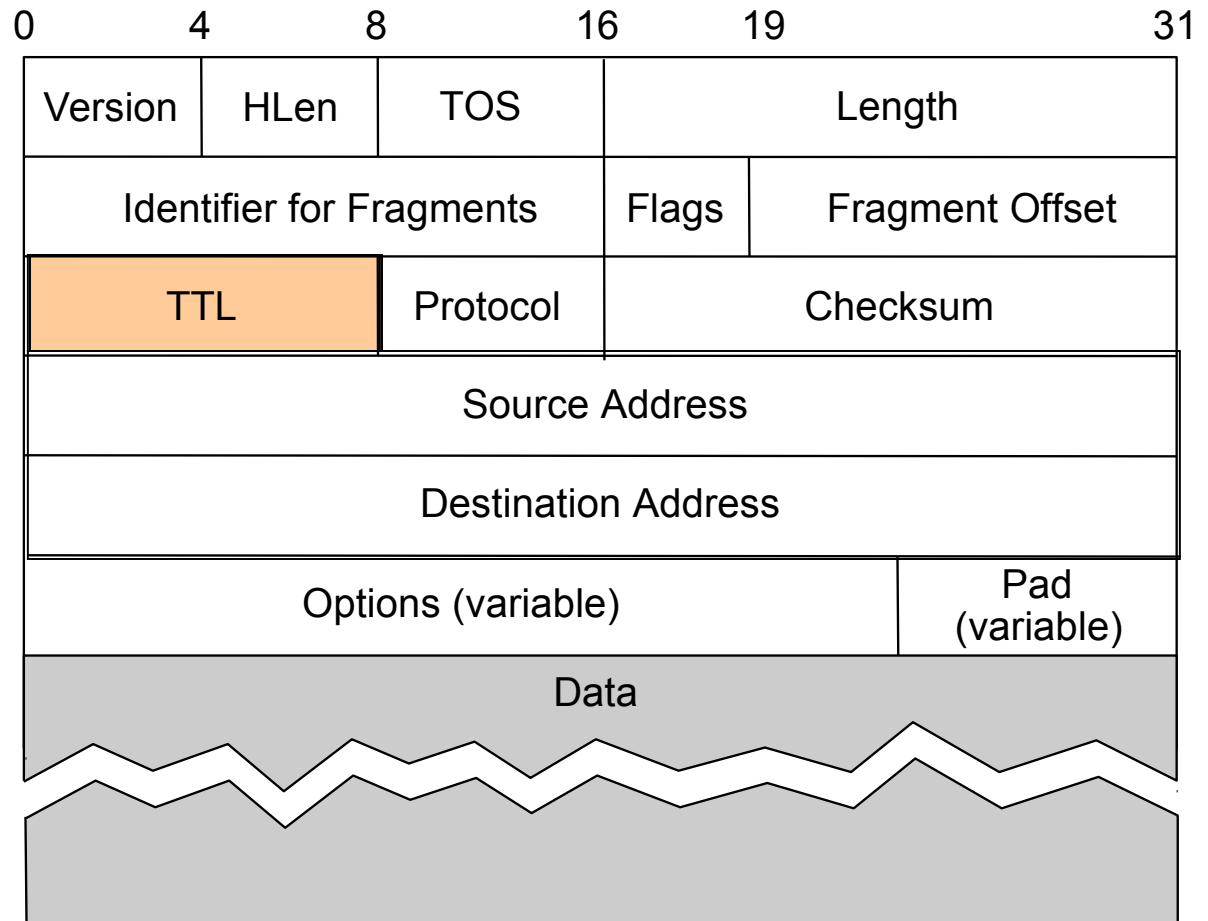

- Strategy
  - fragment only when necessary ( $MTU < \text{Datagram size}$ )
    - try to avoid fragmentation at source host
  - this implies that refragmentation must be possible
    - fragments are self-contained IP datagrams
  - delay reassembly until destination host
  - do not recover from lost fragments

# Avoiding Fragmentation

- Always send small datagrams
  - Might be too small
    - Why does that matter?
- “Guess” MTU of path
  - Use DF flag. May have large startup time
- Discover actual MTU of path
  - One RT delay w/help, much more w/o
    - Hosts send packets, routers return error if too large

# IPv4 Header Fields ...

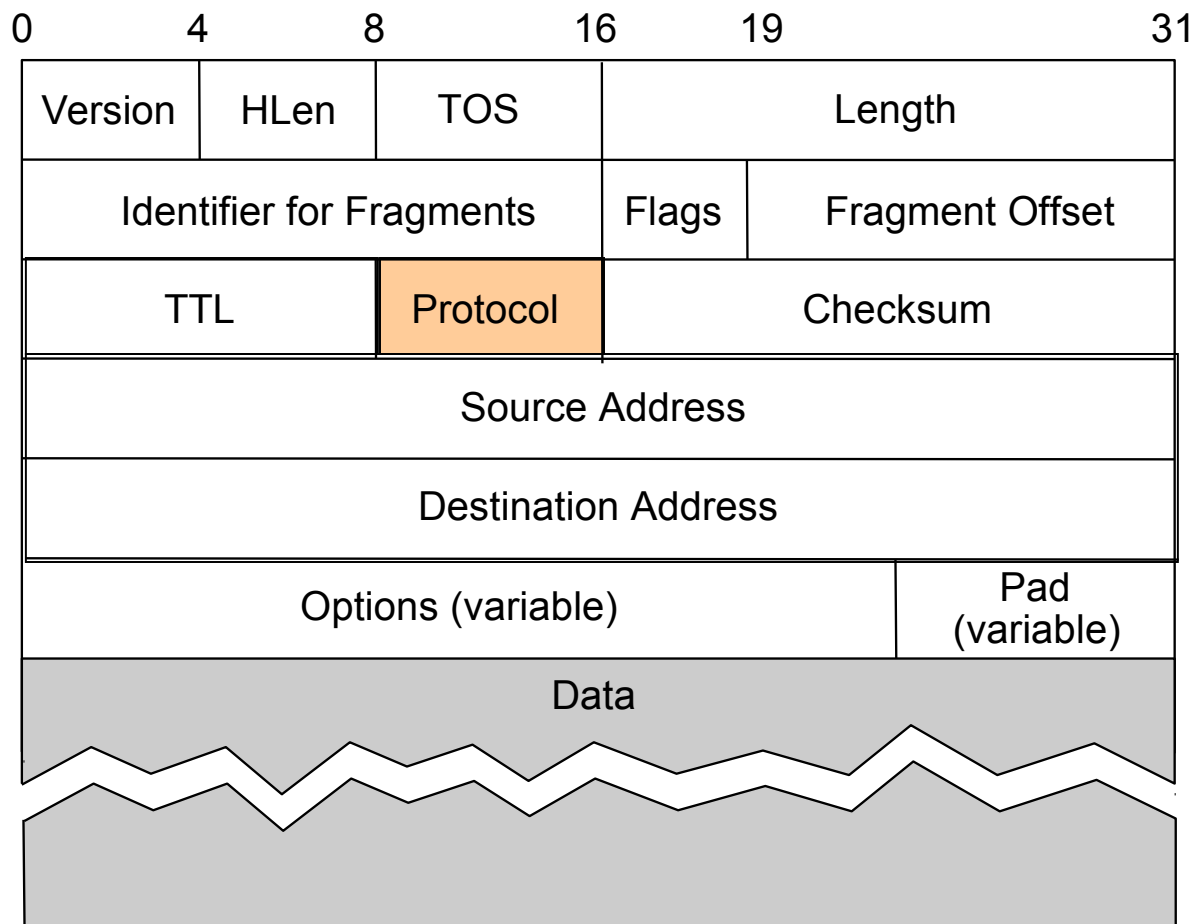

- Time To Live
- Decrement by router and packet discarded if = 0
- Prevents immortal packets
- traceroute

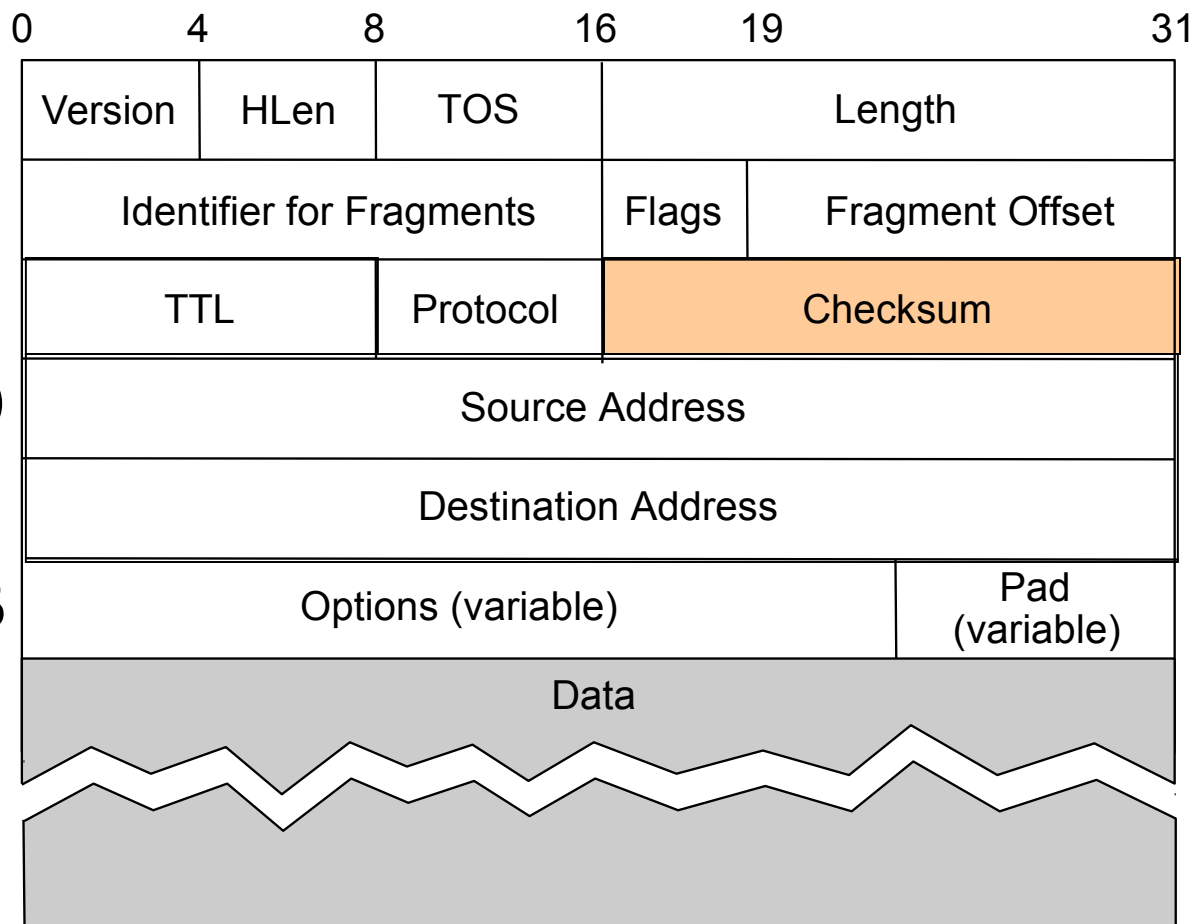

# IPv4 Header Fields ...

- Identifies higher layer protocol
  - E.g., TCP, UDP
- De-mux'ing key at destination host

# IPv4 Header Fields ...

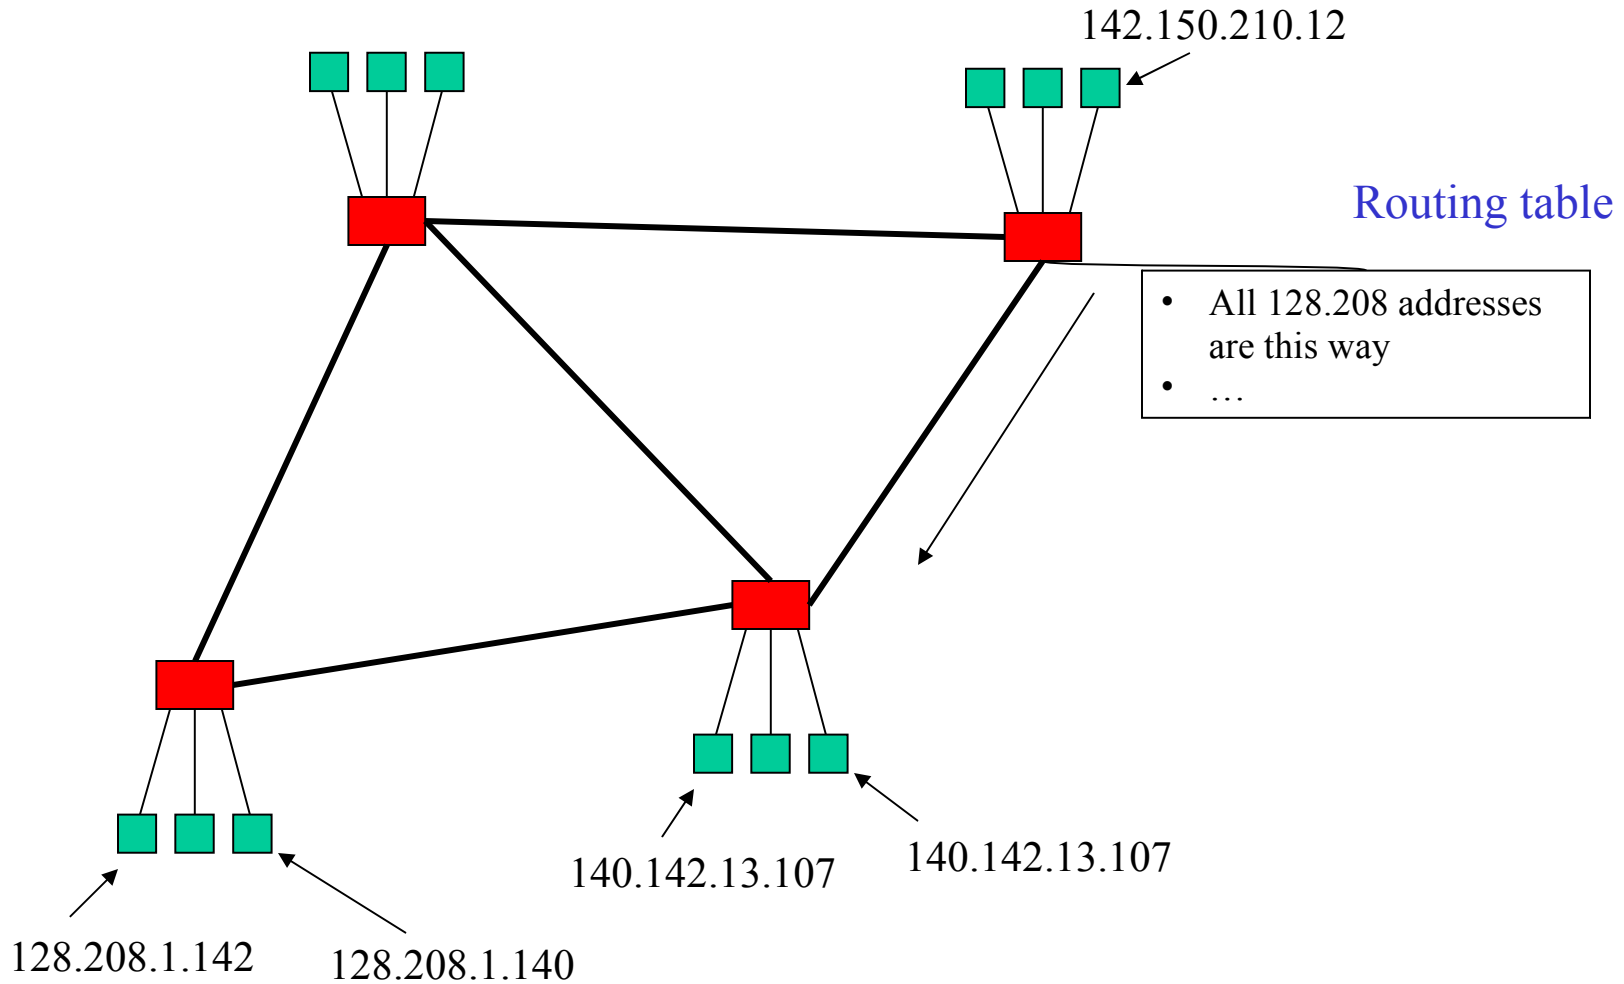

- Header checksum
  - Doesn't cover data
- Recalculated by routers (TTL drops)
- Disappears for IPv6

# IP Addresses and Datagram Forwarding

- IP addresses have hierarchy
  - MAC addresses are basically random
- How the source gets the packet to the destination:
  - if source is on same network (LAN) as destination, source sends packet directly to destination host, using MAC address
  - else source sends data to a router on the same network as the source (using router's MAC address)
  - router will forward packet to a router on the next network over (by sending out through a different one of its interfaces, and MAC address on that network for next router)
  - and so on...
  - until packet arrives at router on same network as destination; then, router sends packet directly to destination host (MAC address)
- Requirements
  - every host needs to know address of a router on its LAN
  - every router needs a routing table to tell it which neighboring network to forward a given packet on
  - Need some kind of support for mapping IP address → MAC address

# IP vs. MAC addresses

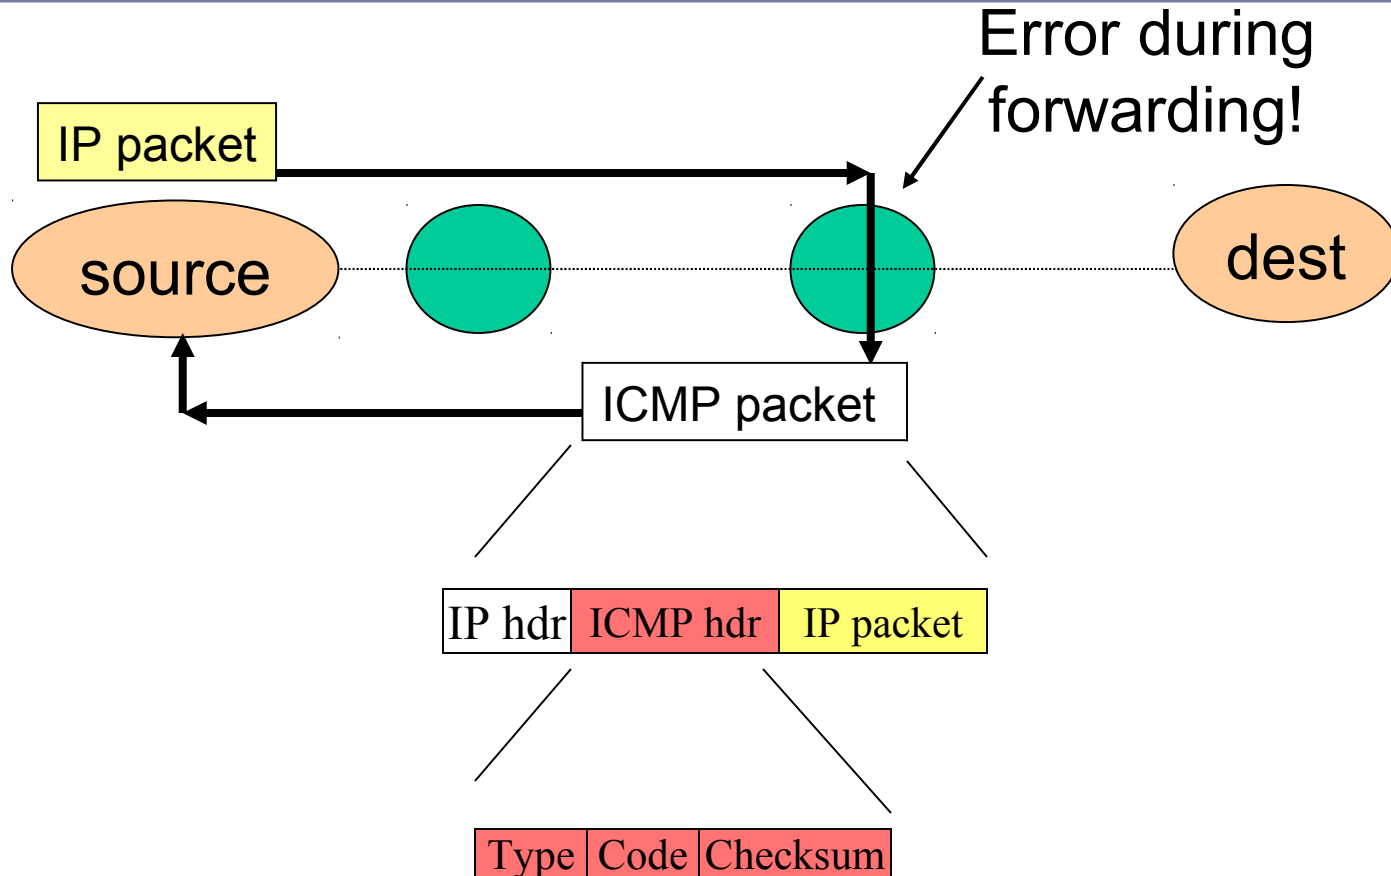

# ICMP

---

- What happens when things go wrong?
  - Need a way to test/debug a large, widely distributed system
- ICMP = Internet Control Message Protocol (RFC792)
  - Companion to IP – required functionality
- Used for error and information reporting:
  - Errors that occur during IP forwarding
  - Queries about the status of the network

# ICMP Generation

# Common ICMP Messages

- Destination unreachable
  - “Destination” can be host, network, port or protocol
- Packet needs fragmenting but DF (don’t fragment) flag is set
- Redirect
  - To shortcut circuitous routing
- TTL Expired
  - Used by the “traceroute” program
- Echo request/reply
  - Used by the “ping” program
- Cannot Fragment
- Busted Checksum
  
- ICMP messages include portion of IP packet that triggered the error (if applicable) in their payload

# ICMP Restrictions

---

- The generation of error messages is limited to avoid cascades ... error causes error that causes error!
- Don't generate ICMP error in response to:
  - An ICMP error
  - Broadcast/multicast messages (link or IP level)
  - IP header that is corrupt or has bogus source address
  - Fragments, except the first
- ICMP messages are often rate-limited too.

# Key Concepts

---

- Network layer provides end-to-end data delivery across an internetwork, not just a LAN
- Routing decisions are sequence of “which hop next?”
  - Packet routing isn't picking a full path
- Next: More detailed look at routing and addressing
