General Information
This is a closed book/laptop examination. You have **50 minutes** to answer as many questions as possible. The number in parentheses at the end of each question indicates the number of points given to the question. There are **5 questions** on this exam (check to make sure you have all of them), and there are a total of **50 points**. Write all of your answers directly on this paper. Make your answers as concise as possible. If there is something in the question that you believe is open to interpretation, then please go ahead and interpret, but state your assumptions in your answer. Remember to **READ THE ENTIRE QUESTION** before answering, as later questions will build on earlier answers.
Problem 1: Basics (10 points)

a) How are hosts with two different link layers (e.g., WiFi and Ethernet) able to communicate? (3 points)

b) What is a simplex link? (1 point)

c) What is a half-duplex link? (1 point)

d) What is the primary approach used to divide network functionality in the Internet? (2 points)

e) Consider a protocol stack composed of WiFi, IP, TCP, and HTTP. Illustrate what the packet on the wire look like for this stack? (3 points)
Problem 2: Modern transport protocols (10 points)

a) Describe MPTCP (multipath TCP) and how it differs from TCP. (5 points)

b) Describe QUIC and how it differs from TCP. (5 points)
Problem 3: IP primitives (10 points)

a) What is ICMP used for? (2 points)

b) Describe two advantages and two disadvantages of NAT (4 points)

c) What was the primary motivation for developing IPv6? (1 point)

d) How can IPv6 traffic be carried over a network that does not support IPv6? (3 points)
Problem 4: Routing and forwarding (10 points)

a) What is difference between routing and forwarding (3 points)

b) What is longest matching prefix? (1 point)

c) Consider a host with IP address 10.10.10.10, prefix 10.10.10.0/24, and gateway 10.10.10.1. How will this host forward packet to following destinations? (3 points)
   i) 10.10.10.11
   ii) 10.10.11.10
   iii) 10.11.10.10

d) Describe three ideas that help routing in the Internet scale? (3 points)
Problem 5: Distance vector and link state (10 points)

a) Describe how distance vector and link state routing algorithms differ? (6 points)

b) Which of the two algorithms converges faster? (1 point)

c) Which of the two algorithms requires more computation (1 point)

d) Give an example of a routing protocol that uses distance vector algorithm (1 point)

e) Given an example of a routing protocol that uses link state algorithm. (1 points)
