# Security and Project 3

Edan, Jason, Mark, Monty

# Symmetric (Secret Key) Encryption

•Alice and Bob have the same secret key, K<sub>AB</sub> •Anyone with the secret key can encrypt/decrypt

# Public Key (Asymmetric) Encryption

Alice and Bob have public/private key pairs (K<sub>B</sub>/K<sub>B</sub><sup>-1</sup>)
 Public keys are well-known, private keys are secret

# Public Key Encryption (2)

•Alice encrypts w/ Bob's pubkey  $K_B^{-1}$ ; anyone can send •Bob decrypts w/ his private key  $K_B^{-1}$ ; only he can

### Man-in-the-Middle Attacks

#### How can we trust a public key?

# Certificates

A certificate binds pubkey to identity, e.g., domain
Distributes public keys when signed by a party you trust
Commonly in a format called X.509

# PKI (Public Key Infrastructure)

•Adds hierarchy to certificates to let parties issue •Issuing parties are called CAs (Certificate Authorities)

# PKI (2)

- •Need public key of PKI root and trust in servers on path to verify a public key of website ABC
  - Browser has Root's public key
  - •{RA1's key is X} signed Root
  - •{CA1's key is Y} signed RA1
  - •{ABC's key Z} signed CA1

# PKI (3)

- •Browser/OS has public keys of the trusted roots of PKI
  - •>100 root certificates!
  - •That's a problem ...
  - Inspect your web browser

Certificate for wikipedia.org issued by DigiCert

| 0   | Certificate Viewer: "*.wikipedia.org"                       |  |  |  |

|   | ✓ <u>C</u> lose   |  |  |  |

# PKI (4)

- •Real-world complication:
  - Public keys may be compromised
  - •Certificates must then be revoked
- •PKI includes a CRL (Certificate Revocation List)
  - Browsers use to weed out bad keys

# Bufferbloat

"Bufferbloat is a cause of high latency in packet-switched networks caused by excess buffering of packets" – Wikipedia

#### Bufferbloat – Cause

- Host doesn't know the bandwidth of the bottleneck link.
- TCP relies solely on packet losses to guide how fast to send.
  - It keeps sending faster and faster until a packet drops.
- With a queue, this can fill up the queue pretty quickly.

#### **Bufferbloat – Problem**

- Suppose h1 knows to send at 1.5 Mb/s, what's the RTT when the queue is full?
   ...when it's not full?
- TCP at the end of the day will operate at the bottleneck bandwidth, but is it necessary to fill up the queue?

#### buffer app limited bandwidth limited limited stope=11 BtlBW RTprop **BtlBw** 5/0pe=1/R/Dron optimum loss-based operating congestion control point is here operates here amount inflight

#### FIGURE 1: DELIVERY RATE AND ROUND-TRIP TIME VS. INFLIGHT

#### A motivational example...

Not all "speedtests" capture bufferbloat... took a long time for the networking community to realize it was a problem!

• A regular "ping" test, used to measure RTT in practice, won't fill the buffers!

Let's as a class try it out:

- <u>https://www.waveform.com/tools/bufferbloat</u>
  - Loaded latency vs. unloaded latency
  - How big is the difference?

#### **Real-world Initiatives**

#### Active Queue Management (AQM)

- Goal is to use better queue management techniques
- Leverage ECN to give fast feedback without causing loss
  - Unfortunately hard to deploy ECN CC "fairly" with existing CC algos (Reno, Cubic)
  - It works so much more responsively (aka better) it tends to takeover throughput from legacy TCP!

L4S "Low-latency, low-loss, scalable throughput" initiative at IETF

- One solution is to mandate a split at bottlenecks, two queues with independent behavior
- Required in latest cable modem standards

## One AQM Technique: FQ\_CODEL

- Initiatives to add *flow-independent* queues to bottleneck routers...
  - like L4S to an extreme...
  - Each flow gets its own queue, and it's the router's job to make them all fair!
  - Attempts to estimate bottleneck and not queue any more than necessary to fill the pipe
    - Similar big idea to BBR
- Available in all modern Linux distros (kernel > 3.16)
  - Default in some
- Default in OpenWRT
  - Used as the basis for some commercial routers too (SpaceX Starlink is a prominent example)
- Relatively resource intensive though, so not feasible on "core" routers yet

### Bufferbloat aware transport: BBR

- Different type of solution than AQM
  - Operates only on end hosts
- Developed at Google in 2016 for YouTube traffic.
- Uses a model instead of loss to formulate how fast to send
  - Probe RTT and latency and predict the bottleneck bandwidth.

#### Project 3 – Goal

- Simulate bufferbloat problem.
- See the worse performance when queue size is larger
- See the difference between TCP Reno and TCP BBR.

#### **Experiment Setup**

- Long-lived TCP flow from h1 to h2
  - Simulate background traffic
- Back-to-back ping from h1 to h2
  - Measure RTT
- Spawn a webserver on h1 and periodically fetch a page
  - Simulate more important load
  - Measure time
- Plot time series of RTT and number of queued packets.

- Run the experiment with
  - $\circ$  Q=20 and Q=100
  - Reno and BBR
  - 4 experiments total

#### Detour – Hypothesize

In groups of 3-4,...

- In your own words, what is bufferbloat problem?
- For each of the 4 experiments (Q=20 or 100; and with Reno or BBR),
  - How do the webpage fetch time compare?
- How would plot between queue size and time look like for TCP Reno?

#### Detour – Hypothesize

In groups of 3-4,...

- In your own words, what is bufferbloat problem?
- For each of the 4 experiments (Q=20 or 100; and with Reno or BBR),
  - How do the webpage fetch time compare?
- How would plot between queue utilization and time look like for TCP Reno?

|      | Q=20  | Q=100        |
|------|-------|--------------|
| Reno | <;=;> | =;><br><;=;> |
| BBR  | <;=   |              |

#### Setup

- Use Mininet VM (same as Project 2)
- Get the starter code and install dependencies

cd ~

wget

https://courses.cs.washington.edu/courses/cse461/22wi/projects/project3/resources/project3.zip

unzip project3.zip

sudo apt-get update

```
sudo apt install python3-pip
```

```
sudo python3 -m pip install mininet matplotlib
```

#### Starter Code

- run.sh
  - Run the entire experiment
    - Run bufferbloat.py on q=20 and q=100
    - Generate latency and queue length graphs
- bufferbloat.py
  - Complete the TODOs
    - Setup the mininet topology and the experiment
    - Write shell commands to do the measurements

#### Long-lived TCP Flow

- Starter code sets up iperf server on h2
- Goal: start iperf client on h1, connect to h2
  - Should be "long-lasting", i.e. for time specified by --time parameter
- How do I connect to a certain IP or make the connection long-lasting?
  - man pages are your friend!
  - type `man iperf` in a Linux terminal

## **Ping Train**

- Goal: Start "ping train" between h1 and h2
  - Pings should occur at 10 per second interval
  - Should run for entire experiment
- How do I specify the ping interval and how long the ping train runs?
  - man pages are your friend!
  - type `man ping` in a Linux terminal
- Write the RTTs recorded from `ping` to {args.dir}/ping.txt
  - See starter code comments for more detail

#### Download Webpage with curl

- Starter code spawns webserver on h1
- Goal: Use `curl` to measure fetch time to download webpage from h1
  - Starter code has hint on formatting curl command
  - Make sure `curl` doesn't output an error
    - Errors report very small latency
- No need to plot fetch times; just need to report average fetch time for each experiment.

#### Plotting

- Starter code contains scripts for plotting, `plot\_queue.py`, `plot\_ping.py`
  - Expects queue occupancy in \$dir/q.txt, ping latency in \$dir/ping.txt
  - Plots are useful for debugging!
- Part 3, run same experiments with TCP BBR instead of TCP Reno
  - How do you expect the graph outputs to differ?

Q = 100
