What is Sound?

As the tines move back and forth they exert pressure on the air around them.
(a) The first displacement of the tine compresses the air molecules causing high pressure.
(b) Equal displacement of the tine in the opposite direction forces the molecules to widely disperse themselves and so, causes low pressure.
(c) These rapid variations in pressure over time form a pattern which propagates itself through the air as a wave. Points of high and low pressure are sometimes referred to as ‘compression’ and ‘rarefaction’ respectively.

Simple Harmonic Motion -- a Pendulum

- When a pendulum approaches equilibrium it doesn’t slow down; it simply travels a smaller distance from the point of rest.
- Any body undergoing simple harmonic motion moves periodically with uniform speed.
- If the tuning fork is moving periodically then the pressure variations it creates will also be periodic.

The time taken to get from position a to b in all three cases is the same.

The Unit Circle

These pressure patterns can be represented using as a circle. Imagine the journey of the pendulum or the tine in four stages:
1) from its point of rest to its first point of maximum displacement...
2) its first point of maximum displacement back through the point of rest...
3) ... to its second point of maximum displacement...
4) ... and back from there through its point of rest again
We can map that journey to a circle. This is called the Unit Circle. The sine wave represents this journey around and around the unit circle over time.

Sine Waves

The sine wave or sinusoid or sinusoidal signal is probably the most commonly used graphic representation of sound waves.
The specific properties of a sine wave are described as follows.

**Frequency**
- Frequency refers to the number of cycles of a wave per second. This is measured in Hertz. So if a sinusoid has a frequency of 100hz then one period of that wave repeats itself every 1/100th of a second. Humans can hear frequencies between 20hz and 20,000hz (20Khz).

1) Frequency is closely related to, but not the same as!!!, pitch.
2) Frequency does not determine the speed a wave travels at. Sound waves travel at approximately 340metres/second regardless of frequency.
3) Frequency is inherent to, and determined by the vibrating body – not the amount of energy used to set that body vibrating. For example, the tuning fork emits the same frequency regardless of how hard we strike it.

**Amplitude**
- Amplitude describes the size of the pressure variations.
- Amplitude is measured along the vertical y-axis.
- Amplitude is closely related to but not the same as!!!, loudness.

The amplitude of a wave changes or ‘decays’ over time as it loses energy.

These changes are normally broken down into four stages: **Attack**, **Decay**, **Sustain** and **Release**.

Collectively, the four stages are described as the **amplitude envelope**.
Quantization

- The digital signal is defined only at the points at which it is sampled.

Quantization

- The height of each vertical bar can take on only certain values, shown by horizontal dashed lines, which are sometimes higher and sometimes lower than the original signal, indicated by the dashed curve.

Quantization

- The difference between a quantized representation and an original analog signal is called the *quantization noise*.
- The more bits for quantization of a signal, the more closely the original signal is reproduced.

Quantization

- Using higher sampling frequency and more bits for quantization will produce better quality digital audio.
- But for the same length of audio, the file size will be much larger than the low quality signal.
Quantization

- The number of bits available to describe sampling values determines the resolution or accuracy of quantization.
- For example, if you have 8-bit analog to digital converters, the varying analog voltage must be quantized to 1 of 256 discrete values;
- a 16-bit converter has 65,536 values.

Nyquist Theorem

- A theorem which states that an analog signal waveform may be uniquely reconstructed, without error, from samples taken at equal time intervals.

Nyquist Theorem

- The sampling rate must be equal to, or greater than, twice the highest frequency component in the analog signal.

Nyquist Theorem

- Stated differently:
  - The highest frequency which can be accurately represented is one-half of the sampling rate.
**Error**

- Sampling an analog signal can introduce ERROR.
- ERROR is the difference between a computed, estimated, or measured value and the true, specified, or theoretically correct value.

**Nyquist Theorem**

- By sampling at TWICE the highest frequency:
  - One number can describe the positive transition, and...
  - One number can describe the negative transition of a single cycle.

**Nyquist Error-- aliasing**

- upper => sampling 6 times per cycle ($fs=6f$);
- middle => sampling 3 times per cycle ($fs=3f$);
- lower => sampling 6 times in 5 cycles, from[1]

**Digital Synthesis Overview**

- Sound is created by manipulating numbers, converting those numbers to an electrical current, and amplifying result.
- Numerical manipulations are the same whether they are done with software or hardware.
- Same capabilities (components) as analog synthesis, plus significant new abilities
Digital Oscillators

- Everything is a Table
  - A table is an indexed list of elements (or values)
  - The index is the address used to find a value

Generate a Sine Tone Digitally (1)

- Compute the sine in real time, every time it is needed.
  - equation: \( \text{signal}(t) = r \sin(\omega t) \)
  - \( t = \) a point in time; \( r = \) the radius, or amplitude of the signal;
    \( \omega (\text{omega}) = 2\pi f \) the frequency
  - Advantages: It's the perfect sine tone. Every value that you need will be the exact value from the unit circle.
  - Disadvantages: must generate every sample of every oscillator present in a synthesis patch from an algorithm. This is very expensive computationally, and most of the calculation is redundant.

Generate a Sine Tone Digitally (2)

- Compute the sine tone once, store it in a table, and have all oscillators look in the table for needed values.
  - Advantages: Much more efficient, hence faster, for the computer. You are not, literally, reinventing the wheel every time.
  - Disadvantages: Table values are discrete points in time. Most times you will need a value that falls somewhere in between two already computed values.

Table Lookup Synthesis

- Sound waves are very repetitive.
- For an oscillator, compute and store one cycle (period) of a waveform.
- Read through the wavetable repeatedly to generate a periodic sound.
Changing Frequency

- The Sample Rate doesn’t change within a synthesis algorithm.
- You can change the speed that the table is scanned by skipping samples.
- Skip size is the increment, better known as the phase increment.
  
  ***Phase increment is a very important concept***

Algorithm for a Digital Oscillator

- Basic, two-step program:
  
  \[
  \text{phase\_index} = \mod_{L}(\text{previous\_phase} + \text{increment})
  \]
  
  \[
  \text{output} = \text{amplitude} \times \text{wavetable}[\text{phase\_index}]
  \]

- Increment = \((\text{TableLength} \times \text{DesiredFrequency}) / \text{SampleRate}\)

If You’re Wrong, it’s Noise

- What happens when the phase increment doesn’t land exactly at an index location in the table?
  
  - It simply looks at the last index location passed for a value. In other words, the phase increment is truncated to the integer.
- Quantization
- Noise
- The greater the error, the more the noise.

Interpolation

- Rather than truncate the phase location...
  
  - Look at the values stored before and after the calculated phase location
  - Calculate what the value would have been at the calculated phase location if it had been generated and stored.
  
  Interpolate

- More calculations, but a much cleaner signal.
Linear interpolation

• Interpolate between two audio samples
  
  ```
  double inbetween = fmod(sample, 1);
  return (1.0 - inbetween) * wave[int(sample)] +
          inbetween * wave[int(sample) + 1];
  ```

• More accurate, yet still efficient

Envelopes

• We commonly will make samples with fixed amplitudes, then make a synthetic envelope for the sound event.

Attack and Release

ADSR

• ADSR: Attack, decay, sustain, release
**FM: General Description**

Simple FM: carrier oscillator has its frequency modulated by the output of a modulating oscillator. Sidebands produced around carrier at multiples of modulating frequency.
- Number generated depends on the amplitude of the modulator.

**Modulator : Carrier Ratio**
- Sidebands at C + and - (n * Modulator)
- Ratio of M:C determines whether spectrum is harmonic or not.
  - Simple integer ratio = harmonic
  - Non-integer ratio = inharmonic

**Modulation Index and Bandwidth**
- The *bandwidth* of the FM spectrum is the number of sidebands present.
- The bandwidth is determined by the Modulation Index
  - \( I = \text{depth of modulation} / \text{modulator} \)
  - \( D \) depth of modulation, which depends on the amount of amplitude applied to modulating oscillator. \( (D = A \times M) \)
- If the index is above zero, then sidebands occur.
Yamaha YMU757B

- Original FM synthesis function
- Discovered at Stanford in 70’s
- Patented and licensed to Yamaha
- Used in famous DX-7 keyboard (and many other products)

**Yamaha YMU757B internals**

Timbre Data

One timbre consists of [parameter for the modulator] and [parameter for the carrier] as a set.

Index 10h, 11h ....... Timbre data for the 1st timbre modulator
Index 12h, 13h ....... Timbre data for the 1st carrier modulator
Index 14h, 15h ....... Timbre data for the 2nd modulator
Index 16h, 17h ....... Timbre data for the 2nd carrier modulator

...... Omitted .........

Index 2Ch, 2Dh ....... Timbre data for the 8th timbre modulator
Index 2Eh, 2Fh ....... Timbre data for the 8th carrier modulator

CSE 466
**Timbre Data**

FL2: Feedback setting
- This function is effective for the operator on the carrier side only. It is used to set the feedback modulation rate. It must set FL2 to 0 for the operator on the modulator side. It is effective after generating the sound.

**Tempo and Start bit**

§31h. Tempo data
- The "tempo" refers to the number of quarter notes reproduced in one measure. Use this setting to set the tempo of the melody used when reproduced. The setting data is: (0700 TEMPO-1)

§32h. FM section control
- ST: This bit is used to control start stop of the melody. Use "0" for the start setting and "1" for the stop setting. CLR: This bit is used to initialize the entire LSI by the software. All the 16 except for "Timbre data register" of Index 0-5E are initialized. Bit CLR itself is not cleared when it is set as "1". Bit CLR should be written "0".

**Volume**

§35h. Speaker volume control

§36h. FM volume control

§37h. Earphone output volume control

**Interrupt register**

§34h. Interrupt control

The internal control data is taken into FIFO which has a capacity for 32 data. At the sounds are reproduced, the data in FIFO are processed and deleted. When the amount of data remaining in FIFO becomes less than the IRQ point set value, an interrupt signal is generated. At this point, set "0" for IRQE and write the continuing musical sound data into FIFO. Make sure that the written data exceeds the IRQ point. After setting the data, reset "1" for IRQE and wait until another interrupt signal is generated.

IRQ point can set 32 ways from 0 (empty) to 31 (1 data vacancy). IRQE is enable bit, set "1" for enable.
Settings and procedure to generate melody

Follow the steps as described below:
1. Set the CLKSEL ($33h) according to the clock frequency inputs for CLK_1.
2. Cancel the power-down mode of the analog section. (Refer to "Resetting sequence of analog section").
3. Set the timber data ($30-32h), timber allotment data ($34h), tempo data ($31h) and volumes ($35-37h) as desired.
4. Enter 32 musical note data ($00h) until FIFO is full.
5. Set the IRQ point value of $34h. (Default at the centre of FIFO).
6. Set "1" for IRQE of $34h.
7. Set "1" for the $7 bit of $32h and start the melody.

What we’re going to do:

• This week:
  – Talk to the FM chip
  – Explore some basic FM sounds
  – Port some birdsongs to our board

• In two weeks:
  – Port sound code to TinyOS and mote
  – Do the Flock
