Chapter 2 2

Must first specify the setting for intelligent agent design

Consider, e.g., the task of designing an automated taxi:

Percepts??

Actions??

Goals??

Environment??

AIMA Slides @Stuart Russell and Peter Norvig, 1998

Outline

- ♦ PAGE (Percepts, Actions, Goals, Environment)
- Environment types
- Agent types

PAGE

Must first specify the setting for intelligent agent design

Consider, e.g., the task of designing an automated taxi:

Percepts?? video, accelerometers, gauges, engine sensors, microphone, GPS,

Actions?? steer, accelerate, brake, horn, speak/display, ...

 $\underline{\underline{\mathsf{Goals}}}$? safety, reach destination, maximize profits, obey laws, passenger comfort, ...

<u>Environment??</u> US urban streets, freeways, traffic, pedestrians, weather, customers, . . .

AIMA Slides ©Stuart Russell and Peter Norvig, 1998 Chapter 2

Chapter 2

Environment types

| | Chess | Backgammon | laxi |
|------------------------|-------|------------|------|
| Accessible?? | | | |
| <u>Deterministic??</u> | | | |
| Episodic?? | | | |
| Static?? | | | |
| Discrete?? | | | |

AIMA Slides ©Stuart Russell and Peter Norvig, 1998

Chapter 2 5

Agent types

Four basic types in order of increasing generality:

- simple reflex agents
- reflex agents with state
- goal-based agents
- utility-based agents

AIMA Slides @Stuart Russell and Peter Norvig, 1998

AIMA Slides ©Stuart Russell and Peter Norvig, 1998

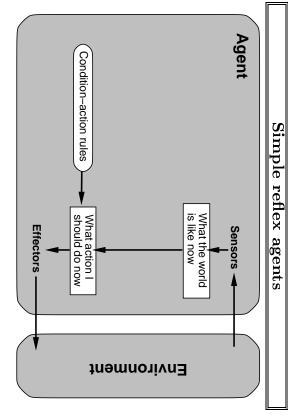

Chapter 2 6

Environment types

| | Chess | Backgammon | Taxi |
|-------------------------|-------|------------|------|
| Accessible?? | Yes | Yes | No |
| <u>Deterministic</u> ?? | Yes | No | No |
| Episodic?? | No | No | No |
| Static?? | Yes | Yes | No |
| Discrete?? | Yes | Yes | No |
| | | | |

The environment type largely determines the agent design

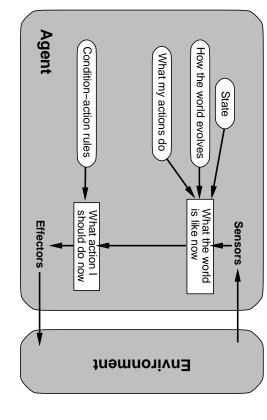

continuous The real world is (of course) inaccessible, stochastic, sequential, dynamic,

Chapter 3 13

Example: Romania

Flight leaves tomorrow from Bucharest On holiday in Romania; currently in Arad

Formulate goal: be in Bucharest

Formulate problem:

states: various cities

operators: drive between cities

Find solution:

sequence of cities, e.g., Arad, Sibiu, Fagaras, Bucharest

AIMA Slides ©Stuart Russell and Peter Norvig, 1998 Chapter 3

Problem-solving agents

Restricted form of general agent:

```
function Simple-Problem-Solving-Agent( p) returns an action
return action
                               action \leftarrow \texttt{Recommendation}(s, state) \\ s \leftarrow \texttt{Remainder}(s, state)
                                                                                                                                                                                                                          if s is empty then
                                                                                                                                                                                                                                                                state \leftarrow \text{Update-State}(state, p)
                                                                                                                                                                                                                                                                                                                                                                                                                                       static: s, an action sequence, initially empty
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                inputs: p, a percept
                                                                                                                                                                                          g \!\leftarrow\! \texttt{Formulate-Goal}(state)
                                                                                                              s \leftarrow \text{Search}(problem)
                                                                                                                                                    problem \leftarrow Formulate-Problem(state, g)
                                                                                                                                                                                                                                                                                                                                                               g, a goal, initially null
                                                                                                                                                                                                                                                                                                                                                                                                     state, some description of the current world state
                                                                                                                                                                                                                                                                                                                         problem, a problem formulation
```

Chapter 3 14

Example: Romania

AIMA Slides ©Stuart Russell and Peter Norvig, 1998 Chapter 3

Problem types

 $\underline{\mathsf{Deterministic}}, \, \underline{\mathsf{accessible}} \Longrightarrow \mathit{single-state} \,\, \mathit{problem}$

Nondeterministic, inaccessible $\implies contingency \ problem$ often interleave search, execution solution is a tree or policy must use sensors during execution

Unknown state space $\implies exploration \ problem$ ("online")

AIMA Slides ©Stuart Russell and Peter Norvig, 1998

Chapter 3 17

Selecting a state space

Real world is absurdly complex

 \Rightarrow state space must be abstracted for problem solving

(Abstract) state = set of real states

For guaranteed realizability, any real state "in Arad" $(\mathsf{Abstract})$ operator = complex combination of real actions must get to some real state "in Zerind" e.g., "Arad \rightarrow Zerind" represents a complex set of possible routes, detours, rest stops, etc.

(Abstract) solution =

set of real paths that are solutions in the real world

Each abstract action should be "easier" than the original problem!

AIMA Slides ©Stuart Russell and Peter Norvig, 1998 Chapter 3

Single-state problem formulation

A problem is defined by four items:

initial state e.g., "at Arad"

 $\frac{operators}{\text{e.g., Arad}} \rightarrow \text{Zerind} \qquad \text{Arad} \rightarrow$ $\mathsf{Arad} \to \mathsf{Sibiu}$ etc.

 $goal\ test$, can be

implicit, e.g., NoDirt(x) $\mathit{explicit}$, e.g., x= "at Bucharest'

 $\underline{path\ cost}$ (additive)

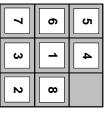

e.g., sum of distances, number of operators executed, etc.

leading from the initial state to a goal state A solution is a sequence of operators
