Introduction to Artificial Intelligence

Planning

Chapter 11

Dieter Fox

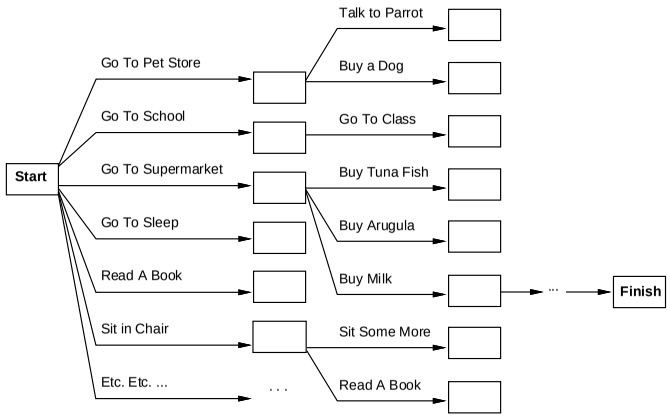
Outline

- ♢ Search vs. planning
- ♢ STRIPS operators
- ♢ Partial-order planning

Search vs. planning

Consider the task *get milk, bananas, and a cordless drill*

Standard search algorithms seem to fail miserably:



After-the-fact heuristic/goal test inadequate

Search vs. planning contd.

Planning systems do the following:

1) open up action and goal representation to allow selection
2) divide-and-conquer by subgoaling
3) relax requirement for sequential construction of solutions

	Search	**Planning**
States	Lisp data structures	Logical sentences
Actions	Lisp code	Preconditions/outcomes
Goal	Lisp code	Logical sentence (conjunction)
Plan	Sequence from S_0	Constraints on actions

Planning in situation calculus

$PlanResult(p, s)$ is the situation resulting from executing p in s

$PlanResult([], s) = s$

$PlanResult([a|p], s) = PlanResult(p, Result(a, s))$

Initial state $At(Home, S_0) \wedge \neg Have(Milk, S_0) \wedge \ldots$

Actions as Successor State axioms

$Have(Milk, Result(a, s)) \Leftrightarrow$

$[(a = Buy(Milk) \wedge At(Supermarket, s)) \vee (Have(Milk, s) \wedge a \neq \ldots)]$

Query

$s = PlanResult(p, S_0) \wedge At(Home, s) \wedge Have(Milk, s) \wedge \ldots$

Solution

$p = [Go(Supermarket), Buy(Milk), Buy(Bananas), Go(HWS), \ldots]$

Principal difficulty: unconstrained branching, hard to apply heuristics

STRIPS operators

Tidily arranged actions descriptions, restricted language

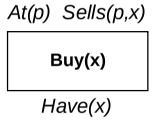
ACTION: $Buy(x)$
PRECONDITION: $At(p), Sells(p, x)$
EFFECT: $Have(x)$

[Note: this abstracts away many important details!]

Restricted language $\Rightarrow$ efficient algorithm

Precondition: conjunction of positive literals

Effect: conjunction of literals



State space vs. plan space

Standard search: node = concrete world state

Planning search: node = **partial plan**

Defn: **open condition** is a precondition of a step not yet fulfilled

Operators on partial plans:

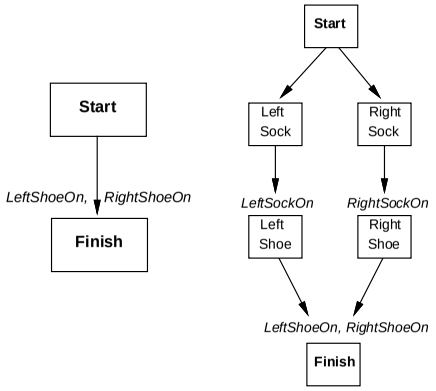
add a link from an existing action to an open condition

add a step to fulfill an open condition

order one step wrt another

Gradually move from incomplete/vague plans to complete, correct plans

Partially ordered plans



A plan is **complete** iff every precondition is achieved

A precondition is **achieved** iff it is the effect of an earlier step and no **possibly intervening** step undoes it

POP algorithm sketch

function POP(*initial, goal, operators*) **returns** *plan*

  plan ← MAKE-MINIMAL-PLAN(*initial, goal*)
  loop do
    if SOLUTION?(*plan*) **then return** *plan*
    S_{need}, c ← SELECT-SUBGOAL(*plan*)
    CHOOSE-OPERATOR(*plan, operators*, S_{need}, c)
    RESOLVE-THREATS(*plan*)
  end

---

function SELECT-SUBGOAL(*plan*) **returns** S_{need}, c

  pick a plan step S_{need} from STEPS(*plan*)
    with a precondition c that has not been achieved
  return S_{need}, c

POP algorithm contd.

procedure CHOOSE-OPERATOR(*plan, operators*, S_{need}, c)

  choose a step S_{add} from *operators* or STEPS(*plan*) that has c as an effect
  if there is no such step **then fail**
  add the causal link $S_{add} \xrightarrow{c} S_{need}$ to LINKS(*plan*)
  add the ordering constraint $S_{add} \prec S_{need}$ to ORDERINGS(*plan*)
  if S_{add} is a newly added step from *operators* **then**
    add S_{add} to STEPS(*plan*)
    add $Start \prec S_{add} \prec Finish$ to ORDERINGS(*plan*)

---

procedure RESOLVE-THREATS(*plan*)

  for each S_{threat} that threatens a link $S_i \xrightarrow{c} S_j$ in LINKS(*plan*) **do**
    choose either
      Demotion: Add $S_{threat} \prec S_i$ to ORDERINGS(*plan*)
      Promotion: Add $S_j \prec S_{threat}$ to ORDERINGS(*plan*)
    if not CONSISTENT(*plan*) **then fail**
  end

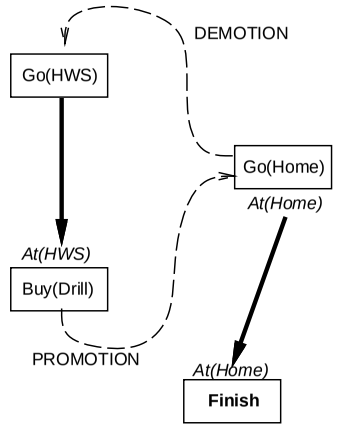
POP algorithm contd.

POP is sound, complete, and **systematic** (no repetition)

Extensions for disjunction, universals, negation, conditionals

Clobbering and promotion/demotion

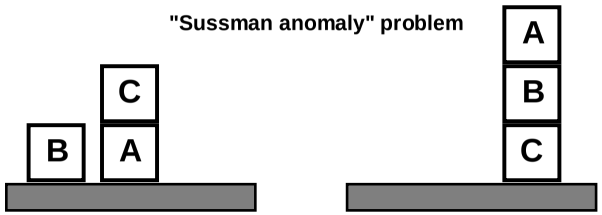
A **clobberer** is a potentially intervening step that destroys the condition achieved by a causal link. E.g., $Go(Home)$ clobbers $At(HWS)$:



Demotion: put before $Go(HWS)$

Promotion: put after $Buy(Drill)$

Example: Blocks world



Clear(x) On(x,z) Clear(y)

PutOn(x,y)

~On(x,z) ~Clear(y)
Clear(z) On(x,y)

Clear(x) On(x,z)

PutOnTable(x)

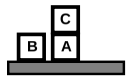
~On(x,z) Clear(z) On(x,Table)

+ several inequality constraints

Example contd.

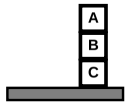
START

On(C,A) On(A,Table) Cl(B) On(B,Table) Cl(C)



On(A,B) On(B,C)

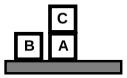
FINISH



Example contd.

START

On(C,A) On(A,Table) Cl(B) On(B,Table) Cl(C)

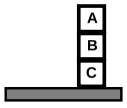


Cl(B) On(B,z) Cl(C)

PutOn(B,C)

On(A,B) On(B,C)

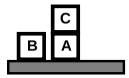
FINISH



Example contd.

START

On(C,A) On(A,Table) Cl(B) On(B,Table) Cl(C)



PutOn(A,B) clobbers Cl(B) => order after PutOn(B,C)

Cl(A) On(A,z) Cl(B)

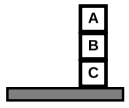
PutOn(A,B)

Cl(B) On(B,z) Cl(C)

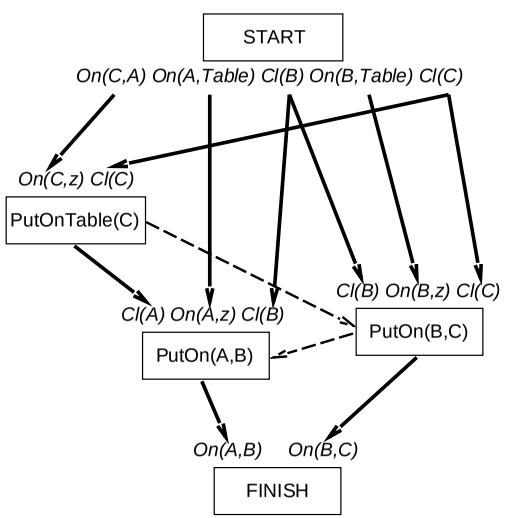
PutOn(B,C)

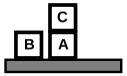
On(A,B) On(B,C)

FINISH



Example contd.





PutOn(A,B) clobbers Cl(B) => order after PutOn(B,C)

PutOn(B,C) clobbers Cl(C) => order after PutOnTable(C)
