LOGICAL AGENTS

CHAPTER 6, AIMA2E CHAPTER 7

Chapter 6, AlMA2e Chapter 7

A simple knowledge-based agent

function KB-AGENT(percept) returns an action ${f static}: \mathit{KB}$, a knowledge base t, a counter, initially 0, indicating time

Tell (KB, Make-Percept-Sentence (percept, t)) $action \leftarrow Ask(KB, Make-Action-Query(t))$ TELL(KB, MAKE-ACTION-SENTENCE(action, t)) return action

The agent must be able to:

Represent states, actions, etc. Incorporate new percepts Update internal representations of the world Deduce hidden properties of the world Deduce appropriate actions

Chapter 6, Al MAze Chapter 7 4

Outline

- ♦ Knowledge-based agents
- ♦ Wumpus world
- ♦ Logic in general—models and entailment
- ♦ Propositional (Boolean) logic
- ♦ Equivalence, validity, satisfiability
- Inference rules and theorem proving
 - forward chaining
 - backward chaining
 - resolution

Wumpus World PEAS description

Performance measure

gold +1000, death -1000

-1 per step, -10 for using the arrow

Environment

Squares adjacent to wumpus are smelly Squares adjacent to pit are breezy Glitter iff gold is in the same square Shooting kills wumpus if you are facing it Shooting uses up the only arrow Grabbing picks up gold if in same square Releasing drops the gold in same square

SS SSSS

(::)^r

SS SSENCH

Sensors Breeze, Glitter, Smell

Actuators Left turn, Right turn, Forward, Grab, Release, Shoot

Chapter 6, Al MAze Chapter 7 5

Chapter 6, AlMAze Chapter 7 2

Knowledge bases

domain-independent algorithms Inference engine Knowledge base domain-specific content

Knowledge base = set of sentences in a formal language

Declarative approach to building an agent (or other system):

 T_{ELL} it what it needs to know

Then it can A_{SK} itself what to do—answers should follow from the KB

Agents can be viewed at the knowledge level

i.e., what they know, regardless of how implemented

Or at the implementation level

i.e., data structures in KB and algorithms that manipulate them

Wumpus world characterization

Chapter 6, AlMAze Chapter 7 19

Logic in general

Logics are formal languages for representing information such that conclusions can be drawn

Syntax defines the sentences in the language

Semantics define the "meaning" of sentences; i.e., define truth of a sentence in a world

E.g., the language of arithmetic

 $x+2 \geq y$ is a sentence; x2+y> is not a sentence

 $x+2 \geq y$ is true iff the number x+2 is no less than the number y

 $x+2 \geq y \text{ is true in a world where } x=7, \ y=1$

 $x+2 \geq y$ is false in a world where $x=0,\ y=6$

Chapter 6, AlMAze Chapter 7 22

Exploring a wumpus world

Chapter 6, AlMAze Chapter 7 28

Entailment

Entailment means that one thing follows from another:

$$KB \models \alpha$$

Knowledge base KB entails sentence α if and only if α is true in all worlds where KB is true

E.g., the KB containing "the Giants won" and "the Reds won" entails "Either the Giants won or the Reds won"

 $\mathsf{E.g.},\ x+y=4\ \mathsf{entails}\ 4=x+y$

Entailment is a relationship between sentences (i.e., *syntax*) that is based on *semantics*

Note: brains process syntax (of some sort)

Chapter 6, AlMAze Chapter 7 23

Other tight spots

Breeze in (1,2) and (2,1) \Rightarrow no safe actions

Assuming pits uniformly distributed, (2,2) has pit w/ prob 0.86, vs. 0.31

S

 $\begin{array}{l} {\sf Smell \ in \ (1,1)} \\ \Rightarrow {\sf cannot \ move} \\ {\sf Can \ use \ a \ strategy \ of \ coercion:} \\ {\sf shoot \ straight \ ahead} \\ {\sf wumpus \ was \ there} \Rightarrow {\sf dead} \Rightarrow {\sf safe} \\ {\sf wumpus \ wasn't \ there} \Rightarrow {\sf safe} \end{array}$

Models

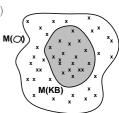

Logicians typically think in terms of models, which are formally structured worlds with respect to which truth can be evaluated

We say m is a model of a sentence α if α is true in m

 $M(\alpha)$ is the set of all models of α

Then $KB \models \alpha$ if and only if $M(KB) \subseteq M(\alpha)$

E.g. $KB = \mbox{Giants}$ won and Reds won $\alpha = \mbox{Giants}$ won

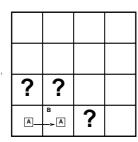

Entailment in the wumpus world

Situation after detecting nothing in [1,1], moving right, breeze in [2,1]

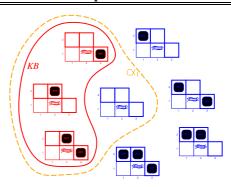

Consider possible models for ?s assuming only pits

3 Boolean choices \Rightarrow 8 possible models

Chapter 6, AIMAze Chapter 7 25

Wumpus models

 $KB = {\sf wumpus\text{-}world\ rules} + {\sf observations}$

 $lpha_1=$ "[1,2] is safe", $KB\modelslpha_1$, proved by model checking

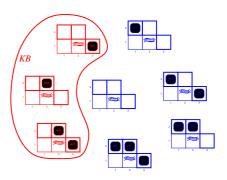

Chapter 6, AlMAze Chapter 7 28

Wumpus models

Chapter 6, AIMA2e Chapter 7 26

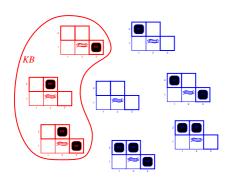

Wumpus models

 $KB = {\sf wumpus\text{-}world\ rules} + {\sf observations}$

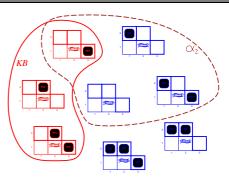

Chapter 6, AIMAze Chapter 7 29

Wumpus models

 $KB = \mathsf{wumpus}\text{-}\mathsf{world}\ \mathsf{rules} + \mathsf{observations}$

Wumpus models

 $KB = {\sf wumpus\text{-}world\ rules} + {\sf observations}$

 $lpha_2=$ "[2,2] is safe", $KB
ot\modelslpha_2$

Inference

 $KB \vdash_i \alpha = \text{sentence } \alpha \text{ can be derived from } KB \text{ by procedure } i$

Consequences of KB are a haystack; α is a needle. Entailment = needle in haystack; inference = finding it

Soundness: i is sound if

whenever $KB \vdash_i \alpha$, it is also true that $KB \models \alpha$

Completeness: i is complete if

whenever $KB \models \alpha$, it is also true that $KB \vdash_i \alpha$

Preview: we will define a logic (first-order logic) which is expressive enough to say almost anything of interest, and for which there exists a sound and complete inference procedure.

That is, the procedure will answer any question whose answer follows from what is known by the KB.

Chapter 6, AlMAze Chapter 7 31

Truth tables for connectives

P	Q	$\neg P$	$P \wedge Q$	$P \lor Q$	$P \Rightarrow Q$	$P \Leftrightarrow Q$
false	false	true	false	false	true	true
false	true	true	false	true	true	false
true	false	false	false	true	false	false
true	true	false	true	true	true	true

Chapter 6, AlMAze Chapter 7 34

Chapter 6. AIM A2e Chapter 7 30

Propositional logic: Syntax

Propositional logic is the simplest logic—illustrates basic ideas

The proposition symbols $P_1,\ P_2$ etc are sentences

If S is a sentence, $\neg S$ is a sentence (negation)

If S_1 and S_2 are sentences, $S_1 \wedge S_2$ is a sentence (conjunction)

If S_1 and S_2 are sentences, $S_1 \vee S_2$ is a sentence (disjunction)

If S_1 and S_2 are sentences, $S_1 \Rightarrow S_2$ is a sentence (implication)

If S_1 and S_2 are sentences, $S_1 \Leftrightarrow S_2$ is a sentence (biconditional)

Wumpus world sentences

Let $P_{i,j}$ be true if there is a pit in [i,j]. Let $B_{i,j}$ be true if there is a breeze in [i,j].

 $\neg P_{1,1}$

 $\neg B_{1,1}$

 $B_{2,\,1}$

"Pits cause breezes in adjacent squares"

Chapter 6, AIMAze Chapter 7 32 Chapter 9, AIMAze Chapter 7 35

Propositional logic: Semantics

Each model specifies true/false for each proposition symbol

(With these symbols, 8 possible models, can be enumerated automatically.)

Rules for evaluating truth with respect to a model m:

Simple recursive process evaluates an arbitrary sentence, e.g.,

 $\neg P_{1,2} \land (P_{2,2} \lor P_{3,1}) = true \land (false \lor true) = true \land true = true$

Wumpus world sentences

Let $P_{i,j}$ be true if there is a pit in [i,j]. Let $B_{i,j}$ be true if there is a breeze in [i,j].

 $\neg P_{1,1}$

 $\neg B_{1,1} \\ B_{2,1}$

"Pits cause breezes in adjacent squares"

 $B_{1,1} \Leftrightarrow (P_{1,2} \vee P_{2,1})$

 $B_{2,1} \Leftrightarrow (P_{1,1} \vee P_{2,2} \vee P_{3,1})$

"A square is breezy if and only if there is an adjacent pit"

Chapter 6. AIMA2e Chapter 7 33

Truth tables for inference

$B_{1,1}$	$B_{2,1}$	$P_{1,1}$	$P_{1,2}$	$P_{2,1}$	$P_{2,2}$	$P_{3,1}$	KB	α_1
false	true							
false	false	false	false	false	false	true	false	true
1	1	:	:	1	:	1	1	1
false	true	false	false	false	false	false	false	true
false	true	false	false	false	false	true	\underline{true}	\underline{true}
false	true	false	false	false	true	false	\underline{true}	\underline{true}
false	true	false	false	false	true	true	\underline{true}	\underline{true}
false	true	false	false	true	false	false	false	true
:	:	1	1	1	1	1		1
true	false	false						

Validity and satisfiability

A sentence is valid if it is true in all models,

$$\mathbf{e}.\mathbf{g}.,\ True,\quad A\vee \neg A,\quad A\ \Rightarrow\ A,\quad (A\wedge (A\ \Rightarrow\ B))\ \Rightarrow\ B$$

Validity is connected to inference via the Deduction Theorem:

 $KB \models \alpha$ if and only if $(KB \Rightarrow \alpha)$ is valid

A sentence is satisfiable if it is true in some model $\mathsf{e}.\mathsf{g}_{\cdot}$, $A \vee B_{\cdot}$ C

A sentence is unsatisfiable if it is true in no models

e.g., $A \land \neg A$

Satisfiability is connected to inference via the following: $KB \models \alpha$ if and only if $(KB \land \neg \alpha)$ is unsatisfiable

i.e., prove α by *reductio ad absurdum*

Chapter 6, AlMA2e Chapter 7 37

Chapter 6, AlMAze Chapter 7 48

Inference by enumeration

Depth-first enumeration of all models is sound and complete

function TT-Entails? (KB, α) returns true or false $symbols \leftarrow$ a list of the proposition symbols in $K\!B$ and α $\textbf{return TT-Check-All}(\textit{KB}, \alpha, \textit{symbols}, [\,])$

function TT-Check-All $(KB, \alpha, symbols, model)$ returns true or falseif Empty?(symbols) then

if PL-True?(KB, model) then return PL-True?(α , model) else return true

else do

 $P \leftarrow \text{First}(symbols); rest \leftarrow \text{Rest}(symbols)$

return TT-CHECK-ALL(KB, α , rest, Extend(P, true, model) and ${\tt TT-CHECK-All}(\mathit{KB},\alpha,\mathit{rest}, {\tt Extend}(P,\mathit{false},\mathit{model})$

 $O(2^n)$ for n symbols; problem is co-NP-complete

Chapter 6, AlMAze Chapter 7 38

Proof methods

Proof methods divide into (roughly) two kinds:

Application of inference rules

- Legitimate (sound) generation of new sentences from old
- Proof = a sequence of inference rule applications
 - Can use inference rules as operators in a standard search alg.
- Typically require translation of sentences into a normal form

Model checking

truth table enumeration (always exponential in n) improved backtracking, e.g., Davis-Putnam-Logemann-Loveland heuristic search in model space (sound but incomplete)

e.g., min-conflicts-like hill-climbing algorithms

Chapter 6, AlMAze Chapter 7 41

Chapter 6, AlMA2c Chapter 7 42

Logical equivalence

Two sentences are logically equivalent iff true in same models: $\alpha \equiv \beta$ if and only if $\alpha \models \beta$ and $\beta \models \alpha$

 $(\alpha \wedge \beta) \equiv (\beta \wedge \alpha)$ commutativity of \wedge

 $(\alpha \lor \beta) \equiv (\beta \lor \alpha)$ commutativity of \lor $((\alpha \wedge \beta) \wedge \gamma) \; \equiv \; (\alpha \wedge (\beta \wedge \gamma)) \quad \text{associativity of } \wedge$ $((\alpha \vee \beta) \vee \gamma) \ \equiv \ (\alpha \vee (\beta \vee \gamma)) \quad \text{associativity of } \vee$

 $\neg (\neg \alpha) \, \equiv \, \alpha \quad {\rm double\text{-}negation \,\, elimination}$ $(\alpha \Rightarrow \beta) \equiv (\neg \beta \Rightarrow \neg \alpha)$ contraposition

 $(\alpha \Rightarrow \beta) \equiv (\neg \alpha \lor \beta)$ implication elimination

 $(\alpha \Leftrightarrow \beta) \equiv ((\alpha \Rightarrow \beta) \land (\beta \Rightarrow \alpha))$ biconditional elimination

 $\neg \left(\alpha \wedge \beta\right) \, \equiv \, \left(\neg \alpha \vee \neg \beta\right) \quad \mathsf{de \; Morgan}$

 $\neg(\alpha \lor \beta) \equiv (\neg \alpha \land \neg \beta)$ de Morgan

 $(\alpha \wedge (\beta \vee \gamma)) \ \equiv \ ((\alpha \wedge \beta) \vee (\alpha \wedge \gamma)) \ \ \text{distributivity of} \ \wedge \ \text{over} \ \vee \ \$ $(\alpha \lor (\beta \land \gamma)) \equiv ((\alpha \lor \beta) \land (\alpha \lor \gamma))$ distributivity of \lor over \land

Forward and backward chaining

Horn Form (restricted)

KB = conjunction of Horn clauses

Horn clause =

♦ proposition symbol; or

 \Diamond (conjunction of symbols) \Rightarrow symbol $\mathsf{E.g.,}\ C \land (B \Rightarrow A) \land (C \land D \Rightarrow B)$

Modus Ponens (for Horn Form): complete for Horn KBs

$$\frac{\alpha_1, \dots, \alpha_n, \qquad \alpha_1 \wedge \dots \wedge \alpha_n \Rightarrow \beta}{\beta}$$

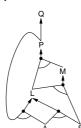

Can be used with forward chaining or backward chaining. These algorithms are very natural and run in linear time

Chapter 6. AlMA2c Chapter 7 39

Forward chaining

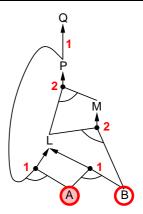

Idea: fire any rule whose premises are satisfied in the $KB_{\rm f}$ add its conclusion to the $KB_{\rm f}$ until query is found

$$\begin{array}{l} P \Rightarrow Q \\ L \wedge M \Rightarrow P \\ B \wedge L \Rightarrow M \\ A \wedge P \Rightarrow L \\ A \wedge B \Rightarrow L \\ B \end{array}$$

Chapter 6, AIMAze Chapter 7 43

Forward chaining example

Chapter 6, AlMAze Chapter 7 46

Forward chaining algorithm

 $\begin{aligned} \textbf{function} \ & \text{PL-FC-Entalls?}(\textit{KB}, q) \ \textbf{returns} \ \textit{true} \ \text{or} \ \textit{false} \\ & \textbf{local variables:} \ \textit{count,} \ \text{a table,} \ \text{indexed by clause,} \ \text{initially the number of premises} \\ & \textit{inferred,} \ \text{a table,} \ \text{indexed by symbol,} \ \text{each entry initially} \ \textit{false} \\ & \textit{agenda,} \ \text{a list of symbols,} \ \text{initially the symbols known to be true} \end{aligned}$

while agenda is not empty \mathbf{do} $p \leftarrow \operatorname{PoP}(agenda)$ unless $inferred[p] \mathbf{do}$ $inferred[p] \leftarrow true$ for each Horn clause c in whose premise p appears \mathbf{do} decrement count[c] if count[c] = 0 then \mathbf{do} $if \operatorname{Head}[c] = q$ then return true $\operatorname{PUSH}(\operatorname{Head}[c], agenda)$

 ${\bf return}\ false$

Chapter 6, AlMA2e Chapter 7 52

Forward chaining example

Chapter 6, AlMAze Chapter 7 5 g

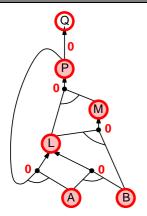

Proof of completeness

FC derives every atomic sentence that is entailed by ${\cal K}{\cal B}$

- 1. FC reaches a fixed point where no new atomic sentences are derived
- 2. Consider the final state as a model $m_{\scriptscriptstyle \parallel}$ assigning true/false to symbols
- 3. Every clause in the original KB is true in mProof. Suppose a clause $a_1 \wedge \ldots \wedge a_k \Rightarrow b$ is false in mThen $a_1 \wedge \ldots \wedge a_k$ is true in m and b is false in mTherefore the algorithm has not reached a fixed point!
- 4. Hence m is a model of KB
- 5. If $KB \models q$, q is true in *every* model of KB, including m

Chapter 6, AlMAze Chapter 7 53

Forward chaining example

Backward chaining

Idea: work backwards from the query q: to prove q by BC, check if q is known already, or prove by BC all premises of some rule concluding q

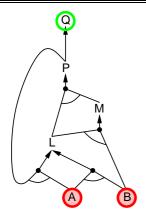

Avoid loops: check if new subgoal is already on the goal stack

Avoid repeated work: check if new subgoal

- 1) has already been proved true, or
- 2) has already failed

Chapter 6, AlMAze Chapter 7 64

Backward chaining example

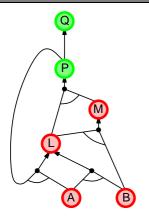

Chapter 6, AlMAze Chapter 7 62

Backward chaining example

Chapter 6, AlM Aze Chapter 7 65

Backward chaining example

Forward vs. backward chaining

FC is data-driven, cf. automatic, unconscious processing, e.g., object recognition, routine decisions

May do lots of work that is irrelevant to the goal

BC is goal-driven, appropriate for problem-solving,

e.g., Where are my keys? How do I get into a PhD program?

Complexity of BC can be much less than linear in size of KB

Chapter 6, AIMA2e Chapter 7 63

Chapter 6, AIMA2e Chapter 7 66

Resolution

Conjunctive Normal Form (CNF—universal) conjunction of disjunctions of literals clauses

$$\mathsf{E.g.},\ (A \vee \neg B) \wedge (B \vee \neg C \vee \neg D)$$

Resolution inference rule (for CNF): complete for propositional logic

$$\frac{\ell_1 \vee \dots \vee \ell_k, \quad m_1 \vee \dots \vee m_n}{\ell_1 \vee \dots \vee \ell_{i-1} \vee \ell_{i+1} \vee \dots \vee \ell_k \vee m_1 \vee \dots \vee m_{j-1} \vee m_{j+1} \vee \dots \vee m_n}$$

where ℓ_i and m_j are complementary literals. E.g.,

$$\frac{P_{1,3} \vee P_{2,2}, \qquad \neg P_{2,2}}{P_{1,3}}$$

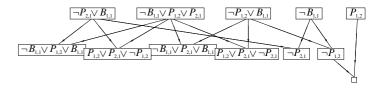

Resolution is sound and complete for propositional logic

Chapter 6, AlMAze Chapter 7 67

Resolution example

$$KB = (B_{1,1} \iff (P_{1,2} \vee P_{2,1})) \wedge \neg B_{1,1} \; \alpha = \neg P_{1,2}$$

Chapter 6, AlMAze Chapter 7 70

Conversion to CNF

 $B_{1,1} \Leftrightarrow (P_{1,2} \vee P_{2,1})$

1. Eliminate \Leftrightarrow , replacing $\alpha \Leftrightarrow \beta$ with $(\alpha \Rightarrow \beta) \land (\beta \Rightarrow \alpha)$.

$$(B_{1,1} \Rightarrow (P_{1,2} \lor P_{2,1})) \land ((P_{1,2} \lor P_{2,1}) \Rightarrow B_{1,1})$$

2. Eliminate \Rightarrow , replacing $\alpha \Rightarrow \beta$ with $\neg \alpha \lor \beta$

$$(\neg B_{1,1} \lor P_{1,2} \lor P_{2,1}) \land (\neg (P_{1,2} \lor P_{2,1}) \lor B_{1,1})$$

3. Move ¬ inwards using de Morgan's rules and double-negation:

$$(\neg B_{1,1} \lor P_{1,2} \lor P_{2,1}) \land ((\neg P_{1,2} \land \neg P_{2,1}) \lor B_{1,1})$$

4. Apply distributivity law (\lor over \land) and flatten:

$$(\neg B_{1,1} \lor P_{1,2} \lor P_{2,1}) \land (\neg P_{1,2} \lor B_{1,1}) \land (\neg P_{2,1} \lor B_{1,1})$$

Chapter 6, AlMAze Chapter 7 68

Summary

Logical agents apply inference to a knowledge base to derive new information and make decisions

Basic concepts of logic:

- syntax: formal structure of sentences
- semantics: truth of sentences wrt models
- entailment: necessary truth of one sentence given another
- inference: deriving sentences from other sentences
- soundess: derivations produce only entailed sentences
- completeness: derivations can produce all entailed sentences

Wumpus world requires the ability to represent partial and negated information, reason by cases, etc.

Forward, backward chaining are linear-time, complete for Horn clauses Resolution is complete for propositional logic

Propositional logic lacks expressive power

Chapter 6, AlMAze Chapter 7 71

Resolution algorithm

Proof by contradiction, i.e., show $KB \wedge \neg \alpha$ unsatisfiable

function PL-Resolution(KB, α) returns true or false $clauses \leftarrow$ the set of clauses in the CNF representation of $K\!B \, \wedge \, \neg \alpha$ $new \leftarrow \{\ \}$ loop do for each C_i , C_j in clauses do $resolvents \leftarrow PL-Resolve(C_i, C_j)$ if resolvents contains the empty clause then return true $new \leftarrow new \cup \ resolvents$ if $new \subseteq clauses$ then return false $clauses \leftarrow clauses \cup new$
