

Planning

CSE 473
AIMA, 10.3 and 11

Overview

- FOL Planning in Situation Calculus
- Planning vs. Problem Solving
- STRIPS Formalism
- Partial Order Planning
- GraphPlan
- SATPlan

FOL Planning: Situation Calculus

- **Situations:** Logical description of world at some point in time
 - $\text{Result}(a,s)$ returns next state / situation
- **Fluents:** Functions and predicates that change over time
 - $\text{Holding}(G_1, S_4)$
- **Atemporal:** Static functions and predicates
 - $\text{Gold}(G_1)$

Situation Calculus

- $\text{Result}([], s) = s$
- $\text{Result}([a|\text{seq}], s) = \text{Result}(\text{seq}, \text{Result}(a, s))$

Situation Calculus

- **Projection task:** Deduce outcome of sequence of actions
- **Planning task:** Find sequence of actions that achieves desired effect
- **Examples:**
 - $\text{At}(\text{Agent}, [1,1], S_0) \wedge \text{At}(G_1, [1,2], S_0)$
 $\wedge \neg \text{Holding}(G_1, S_0)$
 - $\text{Gold}(G_1) \wedge \text{Adjacent}([1,1], [1,2])$
 $\wedge \text{Adjacent}([1,2], [1,1])$

© UW, CSE, AT, Faculty

5

Situation Calculus

- **Projection / prediction / verification:**
 - $\text{At}(G_1, [1,1], \text{Result}([\text{Go}([1,1],[1,2]), \text{Grab}(G_1), \text{Go}([1,2],[1,1])], S_0))$
- **Planning:**
 - $\exists \text{seq } \text{At}(G_1, [1,1], \text{Result}(\text{seq}, S_0))$

© UW, CSE, AT, Faculty

6

Actions in Situation Calculus

- **Possibility axioms:**
 - $\text{At}(\text{Agent}, x, s) \wedge \text{Adjacent}(x, y) \Rightarrow \text{Poss}(\text{Go}(x, y), s)$
 - $\text{Gold}(g) \wedge \text{At}(\text{Agent}, x, s) \wedge \text{At}(g, x, s) \Rightarrow \text{Poss}(\text{Grab}(g), s)$
- **Effect axioms:**
 - $\text{Poss}(\text{Go}(x, y), s) \Rightarrow \text{At}(\text{Agent}, y, \text{Result}(\text{Go}(x, y), s))$
 - $\text{Poss}(\text{Grab}(g), s) \Rightarrow \text{Holding}(g, \text{Result}(\text{Grab}(g), s))$
 - $\text{Poss}(\text{Release}(g), s) \Rightarrow \neg \text{Holding}(g, \text{Result}(\text{Release}(g), s))$
- **Can prove now:**
 - $\text{At}(\text{Agent}, [1,2], \text{Result}(\text{Go}([1,1],[1,2]), S_0))$
 - **Can't show:** $\text{At}(G_1, [1,2], \text{Result}(\text{Go}([1,1],[1,2]), S_0))$

7

Frame Problem

- How to handle the things that are NOT changed by an action?
- A actions, E effects per action, F fluents
- **Representational frame problem:** Size of knowledge base should depend on number of actions and effects, not fluents: $O(AE)$
- **Inferential frame problem:** Updates / prediction of t steps in $O(Et)$ time

© UW, CSE, AT, Faculty

8

Representational Frame Problem

- Naïve solution $O(AF)$:
 - $At(o,x,s) \wedge (a \neq Agent) \wedge \neg Holding(o,s) \Rightarrow At(o,x,Result(Go(y,z),s))$
- Successor-state axioms (Ray Reiter, '91) $O(AE,F)$:
 - Action possible \Rightarrow
(fluent true in result state \Leftrightarrow Action's effect made it true
 \vee It was true before and action didn't change it)
 - $Poss(a,s) \Rightarrow$
 $(At(Agent,y,Result(a,s)) \Leftrightarrow a = Go(x,y)$
 $\vee (At(Agent,y,s) \wedge a \neq Go(y,z)))$
 - $Poss(a,s) \Rightarrow$
 $F(Result(a,s)) \Leftrightarrow (a = A_1 \vee a = A_2 \vee \dots)$
 $\vee F(s) \wedge a \neq A_3 \wedge a \neq A_4 \dots)$

9

GOLOG

- Cognitive robotics
- Robot programming language based on Situation Calculus
- Extensions can handle concurrent actions, stochastic environments, and sensing
- Still too inefficient due to generality

© UW, CSE, AT, Faculty

10

GOLOG Application

© UW, CSE, AT, Faculty

11

Planning

- Given
 - a logical description of the **initial situation**,
 - a logical description of the **goal conditions**, and
 - a logical description of a set of **possible actions**,
- find
 - a **sequence of actions** (a **plan of action**) that brings us from the initial situation to a situation in which the goal conditions hold.

© UW, CSE, AT, Faculty

12

Input Representation

- *Description of initial state of world*
E.g., Set of propositions:
(block a) (block b) (block c) (on-table a) (on-table b) (clear a) (clear b) (clear c) (arm-empty))
- *Description of goal: i.e. set of worlds*
E.g., Logical conjunction
Any world satisfying conjunction is a goal
(and (on a b) (on b c)))
- *Description of available actions*

© UW, CSE, AT, Faculty

13

Planning vs. Problem-Solving

Basic difference: **Explicit, logic-based representation**

- **States/Situations:** descriptions of the world by logical formulae vs. data structures
→ agent can explicitly reason about and communicate with the world.
- **Goal conditions** as logical formulae vs. goal test (black box)
→ agent can reflect on its goals.
- **Operators:** Axioms or transformation on formulae vs. modification of data structures by programs
→ agent can gain information about the effects of actions by inspecting the operators.

© UW, CSE, AT, Faculty

14

Searching in State Space

We could search through the state space and thereby reduce planning to searching.

We can search forwards
(**progression planning**):

Or alternatively, we can start at the goal and work backwards
(**regression planning**).

Possible since the operators provide enough information

© UW, CSE, AT, Faculty

15

Ways to make "plans"

Generative Planning

Reason from **first principles** (knowledge of actions)

Requires **formal model of actions**

Case-Based Planning

Retrieve old plan which worked on similar problem

Revise retrieved plan for this problem

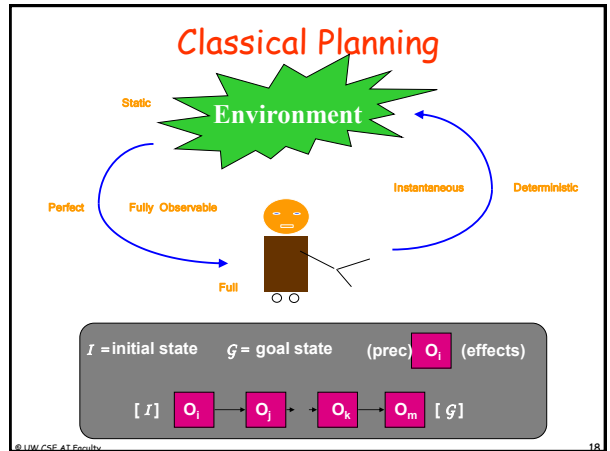

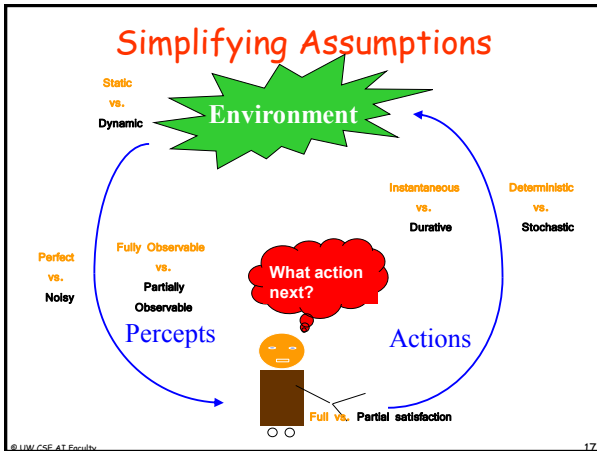

Reinforcement Learning

Act "randomly" - noticing effects

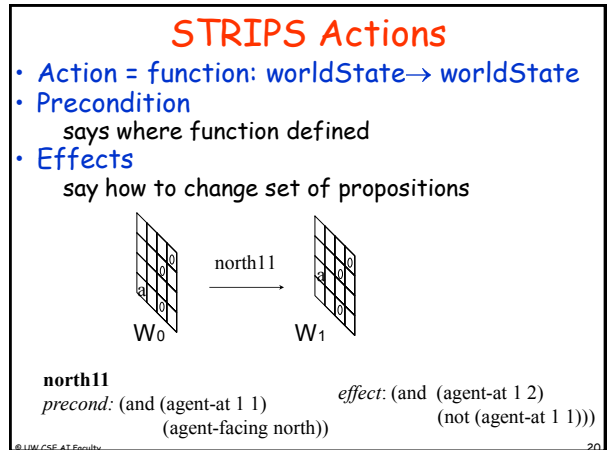

Learn reward, action models, policy

© UW, CSE, AT, Faculty

16

- ### How Represent Actions?
- **Simplifying assumptions**
 - Atomic time
 - Agent is omniscient (no sensing necessary).
 - Agent is sole cause of change
 - Actions have deterministic effects
 - **STRIPS representation**
 - World = set of true propositions (conjunction)
 - Actions:
 - Precondition: (conjunction of positive literals, ground, no functions)
 - Effects (conjunction of literals, ground, no function)
 - Goals = conjunctions (Rich ^ Famous)
- © IJW/CSE AT Faculty 19

Action Schemata

- Instead of defining:
pickup-A and **pickup-B** and ...
- Define a schema:

```
(:operator pick-up
  :parameters ((block ?ob1))
  :precondition (and (clear ?ob1)
                    (on-table ?ob1)
                    (arm-empty))
  :effect (and (not (clear ?ob1))
              (not (on-table ?ob1))
              (not (arm-empty))
              (holding ?ob1)))
```

© UW, CSE, AT, Faculty

21

Forward State-Space Search

- Progression planning
- **Initial state:** set of positive ground literals (CWA: literals not appearing are false)
- **Actions:**
 - applicable if preconditions satisfied
 - add positive effect literals
 - remove negative effect literals
- **Goal test:** checks whether state satisfies goal
- **Step cost:** typically 1

© UW, CSE, AT, Faculty

22

Backward State-Space Search

- Regression planning
- **Problem:** Need to find predecessors of state
- **Problem:** Many possible goal states are equally acceptable.
- From which one does one search?

Initial State is completely defined

© UW, CSE, AT, Faculty

23

Regression

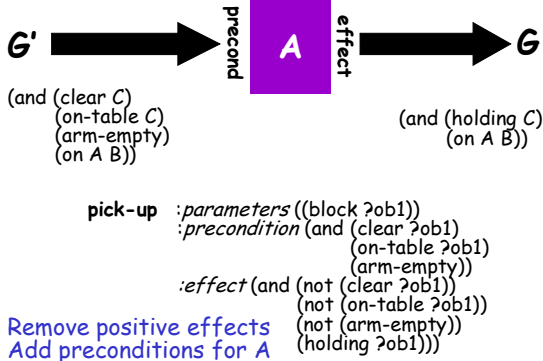

- Let G be a KR sentence (e.g. in logic)
- **Relevance:** needs to achieve one subgoal
- **Consistency:** does not undo any other subgoal
- Regressing a goal, G , thru an action, A yields the weakest precondition G'
 - Such that: if G' is true before A is executed G is guaranteed to be true afterwards

© UW, CSE, AT, Faculty

24

Regression Example

© UW, CSE, AT, Faculty

25

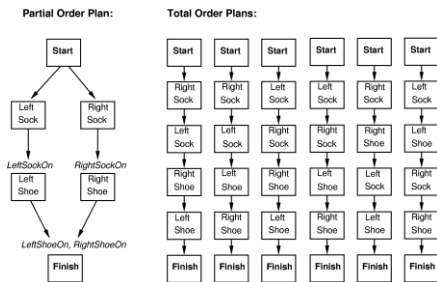

Heuristics for State-Space Search

- Subgoal independence assumption:**
 Cost of solving conjunction is sum of cost of solving each subgoal independently
 Optimistic: ignores negative interactions
 Pessimistic: ignores redundancy
- Relaxed problems:**
 Remove all preconditions from actions and assume subgoal independence \rightarrow heuristic is number of unsatisfied goals
 Remove preconditions and negative effects:
 - Goal($A \wedge B \wedge C$)
 - Action(X , Effect: $B \wedge C \wedge Q$)
 - Action(Z , Effect: $B \wedge P \wedge Q$)
 Set cover problem: NP-hard

© UW, CSE, AT, Faculty

26

Plan = Sequence of Actions?

© UW, CSE, AT, Faculty

27

Searching in Plan Space

Instead of searching in state space, can search in space of all plans.
 Initial state is **partial plan** containing only start and goal states:

Goal state is a complete plan that solves the given problem:

© UW, CSE, AT, Faculty

28

Representation of Partial Order (Non-Linear) Plans

During search, **plan** is represented by sets of

- **actions** (empty plan is Start and Finish only)
- **ordering constraints** ($A < B$: A before B)
- **causal links** $A_i \xrightarrow{c} A_j$ means "A_i produces the precondition c for A_j"
- **open preconditions** (not yet achieved preconditions)
- **variable assignments** $x = t$, where x is a variable and t is a constant or a variable.
- Solutions to planning problems must be **complete** and **consistent**.

© UW, CSE, AT, Faculty

29

Completeness and Consistency

Complete: Every precondition of every step is fulfilled

Consistent: No cycles in ordering constraints and no conflicts with causal links

Shoe example solution:

Actions: { RightSock, RightShoe, LeftSock, LeftShoe, Start, Finish}

Orderings: { RightSock < RightShoe, LeftSock < LeftShoe}

Links: { RightSock $\xrightarrow{\text{RightSockOn}}$ RightShoe, LeftSock $\xrightarrow{\text{LeftSockOn}}$ LeftShoe,

RightShoe $\xrightarrow{\text{RightShoeOn}}$ Finish, LeftShoe $\xrightarrow{\text{LeftShoeOn}}$ Finish}

OpenPreconditions: {}

© UW, CSE, AT, Faculty

30

Searching in Plan Space

- **Successor function:** (plan refinement)
 - pick open precondition p and check all actions that generate p
- **consistency:**
 - add causal link and ordering constraint(s)
 - check whether there are potential conflicts (clobberers) and try to protect violated links
- **Goal test:** No open preconditions

© UW, CSE, AT, Faculty

31

Protection of Causal Links

(a) Conflict: S₃ threatens the causal link between S₁ and S₂.

Conflict solutions:

- (b) **Demotion:** Place threatening step before causal link
- (c) **Promotion:** Place threatening step after causal link

© UW, CSE, AT, Faculty

32

Blocks World Example

"Sussman anomaly" problem

Start State: $Clear(x) \ On(x,z) \ Clear(y)$
 Goal State: $Clear(x) \ On(x,z)$

PutOn(x,y)
 PutOnTable(x)

$\sim On(x,z) \ \sim Clear(y)$
 $Clear(z) \ On(x,y)$

+ several inequality constraints

Blocks World Example

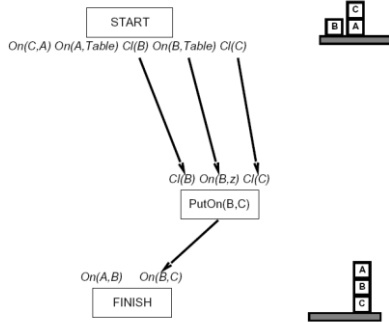

START
 $On(C,A) \ On(A,Table) \ Cl(B) \ On(B,Table) \ Cl(C)$

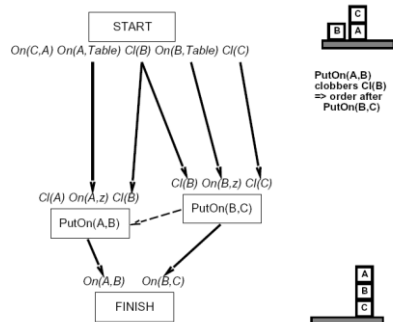

$On(A,B) \ On(B,C)$
 FINISH

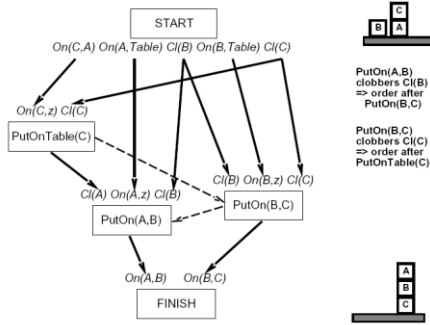

Blocks World Example

Blocks World Example

Blocks World Example

POP Algorithm

Correctness: Every result of the POP algorithm is a complete, correct plan.

Completeness: If breadth-first-search is used, the algorithm finds a solution, given one exists.

GraphPlan: Basic idea

- Construct a graph that encodes constraints on possible plans
- Use this "planning graph" to constrain search for a valid plan:
 If valid plan exists, it's a subgraph of the planning graph
- Planning graph can be built for each problem in polynomial time

Problems handled by GraphPlan*

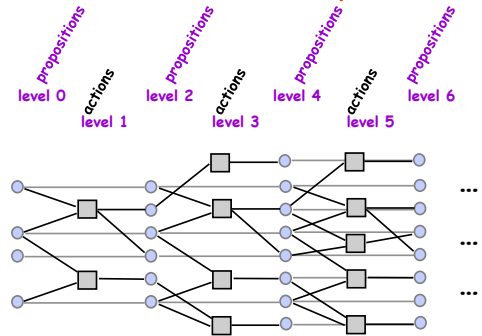

- Pure STRIPS operators:
 conjunctive preconditions
 no negated preconditions
 no conditional effects
 no universal effects
- Finds "shortest parallel plan"
- Sound, complete and will terminate with failure if there is no plan.

*Version in [Blum & Furst IJCAI 95, AIJ 97].
 later extended to handle all these restrictions [Koehler et al 97]

Graphplan

- **Phase 1 - Graph Expansion**
 - Necessary (insufficient) conditions for plan existence
 - Local consistency of plan-as-CSP
- **Phase 2 - Solution Extraction**
 - Variables
 - action execution at a time point
 - Constraints
 - goals, subgoals achieved
 - no side-effects between actions

The Plan Graph

Note: a few noops missing for clarity

Graph Expansion

Proposition level 0

initial conditions

Action level i

no-op for each proposition at level i-1

action for each operator instance whose

preconditions exist at level i-1

Proposition level i

effects of each no-op and action at level i

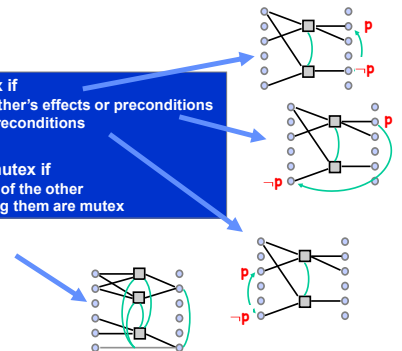

Mutual Exclusion

Two actions are mutex if

- one clobbers the other's effects or preconditions
- they have mutex preconditions

Two proposition are mutex if

- one is the negation of the other
- all ways of achieving them are mutex

Graphplan

- Create level 0 in planning graph
- Loop
 - If goal \subseteq contents of highest level (nonmutex)
 - Then search graph for solution
 - If find a solution then return and terminate
 - Else extend graph one more level

*A kind of double search: forward direction checks necessary (but insufficient) conditions for a solution, ...
Backward search verifies...*

© UW, CSE, AT, Faculty

45

Searching for a Solution Plan

- Backward chain on the planning graph
- Achieve goals level by level
- At level k, pick a subset of non-mutex actions to achieve current goals. Their preconditions become the goals for k-1 level.
- Build goal subset by picking each goal and choosing an action to add. Use one already selected if possible. Do forward checking on remaining goals (backtrack if can't pick non-mutex action)

© UW, CSE, AT, Faculty

46

Searching for a Solution

If goals are present & non-mutex:
Choose action to achieve each goal
Add preconditions to next goal set

© UW, CSE, AT, Faculty

47

Dinner Date

Initial Conditions: (:and (cleanHands) (quiet))

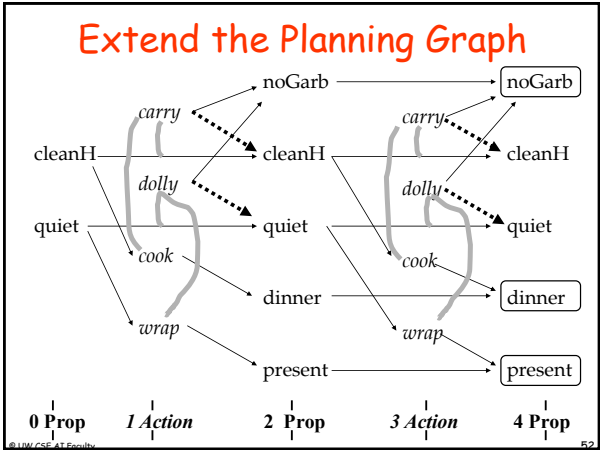

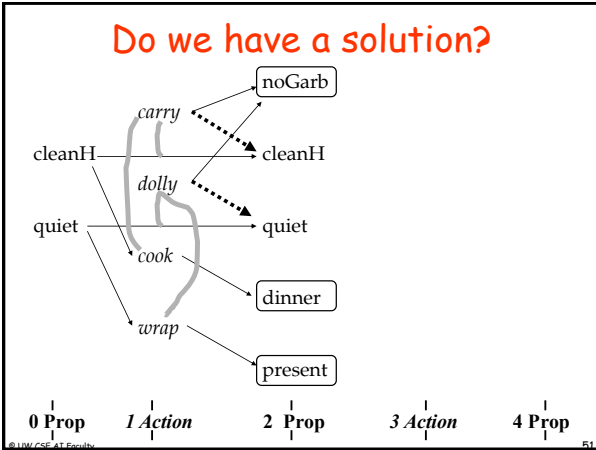

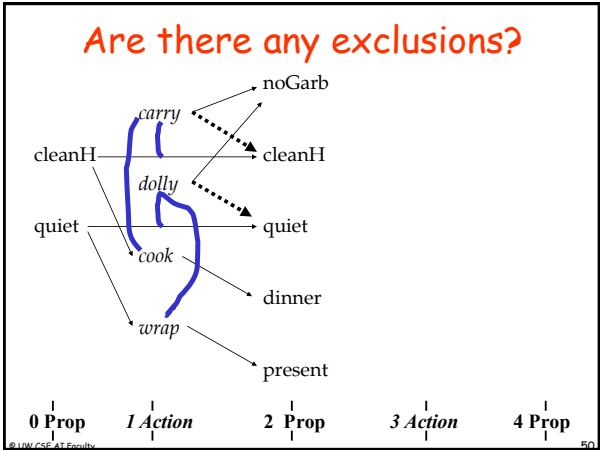

Goal: (:and (noGarbage) (dinner) (present))

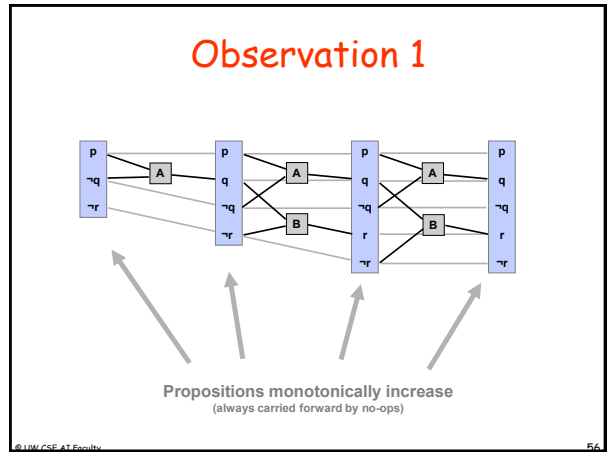

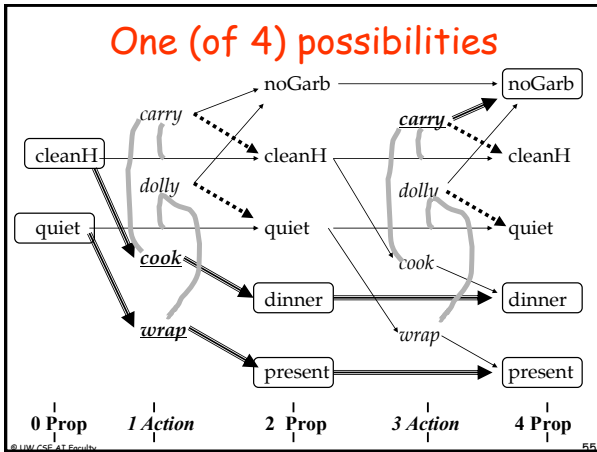

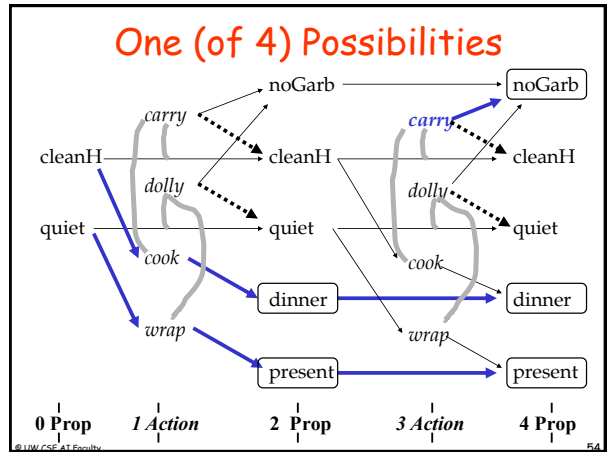

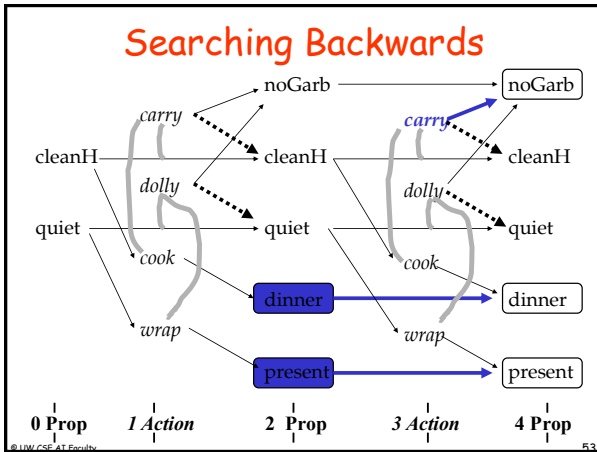

Actions:

```
(:operator carry :precondition
  :effect (:and (noGarbage) (:not (cleanHands))))
(:operator dolly :precondition
  :effect (:and (noGarbage) (:not (quiet))))
(:operator cook :precondition (cleanHands)
  :effect (dinner))
(:operator wrap :precondition (quiet)
  :effect (present))
```

© UW, CSE, AT, Faculty

48

Observation 2

© UW, CSE, AT, Faculty

57

Observation 3

© UW, CSE, AT, Faculty

58

Observation 4

© UW, CSE, AT, Faculty

59

Observation 5

Planning Graph 'levels off'.

- After some time k all levels are identical
- Because it's a finite space, the set of literals never decreases and mutexes don't reappear.

© UW, CSE, AT, Faculty

60

The Last Word on Planning: SATPlan

- Idea: test the *satisfiability* of the logical sentence:
 $(\text{initial state}) \wedge (\text{all possible action descriptions for } t \text{ steps}) \wedge (\text{goal achieved at step } t)$
- Create and test sentence for each t , $t = 0, 1, 2, \dots, T_{\max}$
- Action descriptions include
 1. Successor-state axioms from situation calculus (superscript denotes t)
E.g., $\text{At}(P1, \text{JFK})^t \Leftrightarrow (\text{At}(P1, \text{SFO})^0 \wedge \text{Fly}(P1, \text{SFO}, \text{JFK})^0) \vee (\text{At}(P1, \text{JFK})^0 \wedge \neg \text{Fly}(P1, \text{JFK}, \text{SFO})^0)$
 2. Precondition axioms E.g., $\text{Fly}(P1, \text{SFO}, \text{JFK})^0 \Rightarrow \text{At}(P1, \text{SFO})^0$
 3. State constraints.
E.g., $\forall p, x, y, t \ (x \neq y) \Rightarrow \neg(\text{At}(p, x)^t \wedge \text{At}(p, y)^t)$

© UW, CSE, AT, Faculty

61

Planning using SATPlan

- Sentence to be tested (for a particular t):
 $(\text{initial state}) \wedge (\text{all possible action descriptions}) \wedge (\text{goal})$
- A model will assign true to actions that are part of correct plan and false to other actions
If no plan exists, sentence will be unsatisfiable
- Use SAT solver such as DPLL or WalkSAT to test satisfiability (and find plan if one exists)
- SATPlan can handle large planning problems
E.g., Up to 30-step plans in blocks world

© UW, CSE, AT, Faculty

62

Some Applications of Planning

- Assembly line planning at Hitachi
- Software procurement planning at Price Waterhouse
- Back-axle assembly planning at Jaguar Cars
- Logistics planning in the US Navy
- Scheduling mission-command sequences for satellites
- Observation planning for Hubble telescope
- Spacecraft control for Deep Space One probe
- Etc.

© UW, CSE, AT, Faculty

63

Planning Summary

- Problem solving algorithms that operate on explicit propositional representations of states and actions.
- Make use of specific **heuristics**.
- **STRIPS**: restrictive propositional language
- **State-space search**: forward (progression) / backward (regression) search
- **Partial order planners** search space of plans from goal to start, adding actions to achieve goals
- **GraphPlan**: Generates planning graph to guide backwards search for plan
- **SATplan**: Converts planning problem into propositional axioms. Uses SAT solver to find plan.
