CSE 473: Artificial Intelligence Markov Models

Steve Tanimoto --- University of Washington

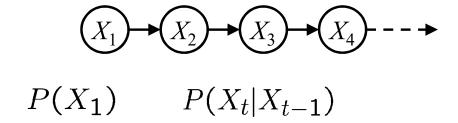

[Most slides were created by Dan Klein and Pieter Abbeel for CS188 Intro to AI at UC Berkeley. All CS188 materials are available at http://ai.berkeley.edu.]

Reasoning over Time or Space

- Often, we want to reason about a sequence of observations
 - Speech recognition
 - Robot localization
 - User attention
 - Medical monitoring
- Need to introduce time (or space) into our models

Markov Models

Value of X at a given time is called the state

- Parameters: called transition probabilities or dynamics, specify how the state evolves over time (also, initial state probabilities)
- Stationarity assumption: transition probabilities the same at all times
- Same as MDP transition model, but no choice of action

Joint Distribution of a Markov Model

$$X_1 \rightarrow X_2 \rightarrow X_3 \rightarrow X_4$$

$$P(X_1) \qquad P(X_t|X_{t-1})$$

Joint distribution:

$$P(X_1, X_2, X_3, X_4) = P(X_1)P(X_2|X_1)P(X_3|X_2)P(X_4|X_3)$$

More generally:

$$P(X_1, X_2, \dots, X_T) = P(X_1)P(X_2|X_1)P(X_3|X_2)\dots P(X_T|X_{T-1})$$

$$= P(X_1)\prod_{t=2}^{T} P(X_t|X_{t-1})$$

- Questions to be resolved:
 - Does this indeed define a joint distribution?
 - Can every joint distribution be factored this way, or are we making some assumptions about the joint distribution by using this factorization?

Chain Rule and Markov Models

From the chain rule, every joint distribution over X_1, X_2, X_3, X_4 can be written as:

$$P(X_1, X_2, X_3, X_4) = P(X_1)P(X_2|X_1)P(X_3|\underline{X_1}, X_2)P(X_4|\underline{X_1}, X_2, X_3)$$

Assuming that

$$X_3 \perp \!\!\! \perp X_1 \mid X_2$$
 and $X_4 \perp \!\!\! \perp X_1, X_2 \mid X_3$

simplifies to the expression posited on the previous slide:

$$P(X_1, X_2, X_3, X_4) = P(X_1)P(X_2|X_1)P(X_3|X_2)P(X_4|X_3)$$

Chain Rule and Markov Models

$$X_1$$
 X_2 X_3 X_4 X_4

From the chain rule, every joint distribution over X_1, X_2, \dots, X_T can be written as:

$$P(X_1, X_2, \dots, X_T) = P(X_1) \prod_{t=2}^{T} P(X_t | X_1, X_2, \dots, X_{t-1})$$

Assuming that for all t:

$$X_t \perp \!\!\! \perp X_1, \ldots, X_{t-2} \mid X_{t-1}$$

simplifies to the expression posited on the earlier slide:

$$P(X_1, X_2, \dots, X_T) = P(X_1) \prod_{t=2}^{T} P(X_t | X_{t-1})$$

Implied Conditional Independencies

$$X_1$$
 X_2 X_3 X_4

- We assumed: $X_3 \perp \!\!\! \perp X_1 \mid X_2$ and $X_4 \perp \!\!\! \perp X_1, X_2 \mid X_3$
- Do we also have $X_1 \perp \!\!\! \perp X_3, X_4 \mid X_2$?
 - Yes!
 - Proof: $P(X_1 \mid X_2, X_3, X_4) = \frac{P(X_1, X_2, X_3, X_4)}{P(X_2, X_3, X_4)}$ $= \frac{P(X_1)P(X_2 \mid X_1)P(X_3 \mid X_2)P(X_4 \mid X_3)}{\sum_{x_1} P(x_1)P(X_2 \mid x_1)P(X_3 \mid X_2)P(X_4 \mid X_3)}$ $= \frac{P(X_1, X_2)}{P(X_2)}$

 $= P(X_1 | X_2)$

Markov Models Recap

- Explicit assumption for all $t: X_t \perp \!\!\! \perp X_1, \ldots, X_{t-2} \mid X_{t-1}$
- Consequence, joint distribution can be written as:

$$P(X_1, X_2, \dots, X_T) = P(X_1)P(X_2|X_1)P(X_3|X_2)\dots P(X_T|X_{T-1})$$

$$= P(X_1)\prod_{t=2}^{T} P(X_t|X_{t-1})$$

Implied conditional independencies:

i.e., if
$$t_1 < t_2 < t_3$$
 then: $X_{t_1} \perp \!\!\! \perp X_{t_3} \mid X_{t_2}$

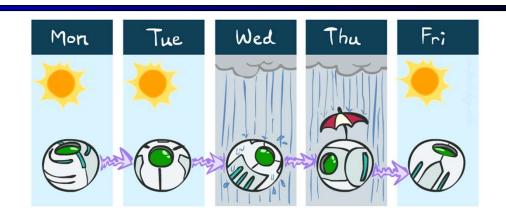

Example Markov Chain: Weather

States: X = {rain, sun}

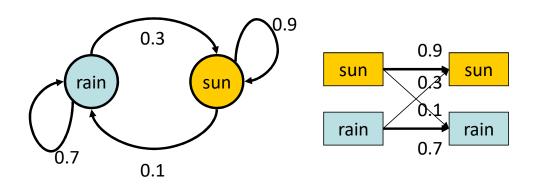

Initial distribution: 1.0 sun

X _{t-1}	X _t	$P(X_{t} X_{t-1})$
sun	sun	0.9
sun	rain	0.1
rain	sun	0.3
rain	rain	0.7

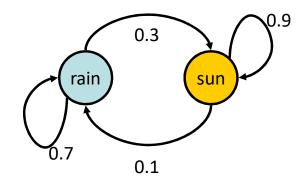

Two new ways of representing the same CPT

Example Markov Chain: Weather

Initial distribution: 1.0 sun

What is the probability distribution after one step?

$$P(X_2 = \text{sun}) = P(X_2 = \text{sun}|X_1 = \text{sun})P(X_1 = \text{sun}) + P(X_2 = \text{sun}|X_1 = \text{rain})P(X_1 = \text{rain})$$

 $0.9 \cdot 1.0 + 0.3 \cdot 0.0 = 0.9$

Mini-Forward Algorithm

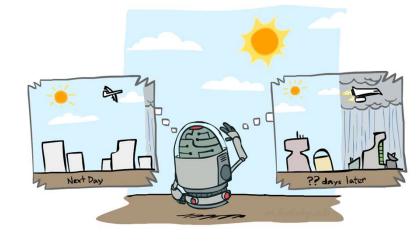

• Question: What's P(X) on some day t?

$$P(x_1) = \text{known}$$

$$P(x_t) = \sum_{x_{t-1}} P(x_{t-1}, x_t)$$

$$= \sum_{x_{t-1}} P(x_t \mid x_{t-1}) P(x_{t-1})$$
Forward simulation

Example Run of Mini-Forward Algorithm

From initial observation of sun

From initial observation of rain

• From yet another initial distribution $P(X_1)$:

$$\left\langle \begin{array}{c} p \\ 1-p \end{array} \right\rangle \qquad \cdots \qquad \left\langle \begin{array}{c} 0.75 \\ 0.25 \end{array} \right\rangle$$

$$P(X_1) \qquad P(X_{\infty})$$

Stationary Distributions

- For most chains:
 - Influence of the initial distribution gets less and less over time.
 - The distribution we end up in is independent of the initial distribution
- Stationary distribution:
 - The distribution we end up with is called the stationary distribution P_{∞} of the chain
 - It satisfies

$$P_{\infty}(X) = P_{\infty+1}(X) = \sum_{x} P(X|x)P_{\infty}(x)$$

Example: Stationary Distributions

Question: What's P(X) at time t = infinity?

$$P_{\infty}(sun) = P(sun|sun)P_{\infty}(sun) + P(sun|rain)P_{\infty}(rain)$$

$$P_{\infty}(rain) = P(rain|sun)P_{\infty}(sun) + P(rain|rain)P_{\infty}(rain)$$

$$P_{\infty}(sun) = 0.9P_{\infty}(sun) + 0.3P_{\infty}(rain)$$

$$P_{\infty}(rain) = 0.1P_{\infty}(sun) + 0.7P_{\infty}(rain)$$

$$P_{\infty}(sun) = 3P_{\infty}(rain)$$

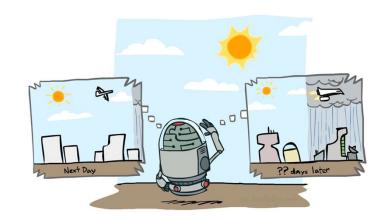

$$P_{\infty}(rain) = 1/3P_{\infty}(sun)$$

$$P_{\infty}(sun) = 3/4$$
$$P_{\infty}(rain) = 1/4$$

$$P_{\infty}(rain) = 1/4$$

X _{t-1}	X _t	$P(X_{t} X_{t-1})$
sun	sun	0.9
sun	rain	0.1
rain	sun	0.3
rain	rain	0.7

Application of Stationary Distribution: Web Link Analysis

PageRank over a web graph

- Each web page is a state
- Initial distribution: uniform over pages
- Transitions:
 - With prob. c, uniform jump to a random page (dotted lines, not all shown)
 - With prob. 1-c, follow a random outlink (solid lines)

Stationary distribution

- Will spend more time on highly reachable pages
- E.g. many ways to get to the Acrobat Reader download page
- Somewhat robust to link spam
- Google 1.0 returned the set of pages containing all your keywords in decreasing rank, now all search engines use link analysis along with many other factors (rank actually getting less important over time)
