

CSE481C: Multi-Robot Systems

Lecture 2: Communications

2008-01-06

CSE481C: Robotics Capstone, Lec2: Communications

1

Communications is Necessary

This is the main difference between multi-robot systems and single robot systems

- All the data is not on a single computer
- Some kind of communications is required to cooperate

The communication cost of getting the data onto a single computer is often high

- Often too high to pay
- Multi-robot communications needs to consolidate this data somehow

3

Concepts

End-to-end Principle

- Put the intelligence at the ends
- Let the stuff in the middle be stupid

Best-Effort Routing

- "We'll do our best to deliver your packet"
- No guarantee on time or path

Time

- Asynchronous: Ethernet CSMA, Exponential Random backoff
- Synchronous: Big global clock, distributed synchronizers

2008-01-06

CSE481C: Robotics Capstone, Lec2: Communications

4

Routing

Flooding

- simple
- lots of wasted messages

Routing tables

- distance vector (RIP) routing
- each node has a routing table to all other nodes

Hierarchical routing

- requires much smaller routing tables
- need asymmetrical hardware to handle lots of packets
- but what if the network is changing frequently?

Graphical routing

- You can use the position of the node as a type of hierarchy
- Get packet close to the destination, then simple routing tables can do the rest

2008-01-06

CSE481C: Robotics Capstone, Lec2: Communications

5

Ad-hoc networks

Sensor networks

- simple hardware
- limited bandwidth and processing

Building trees

- Use a broadcast flood
- Build efficient routing structures dynamically

2008-01-06

CSE481C: Robotics Capstone, Lec2: Communications

6

SwarmBot Summary

7. application: Shared memory API
6. presentation: n/a
5. session: n/a
4. transport: n/a
3. network: Broadcast trees
2. data link: 8-byte packets
1. physical: IR with Manchester encoding

9

Broadcast Tree Construction

Broadcast flood

2008-01-06

CSE481C: Robotics Capstone, Lec2: Communications

10

Message Speed

s_{message} (computed) = 3.66 m/s
 s_{message} (measured) = 3.64 m/s

2008-01-06

$n = 44$, $\tau = 0.250\text{s}$, speed = 0, RSR = 0

11

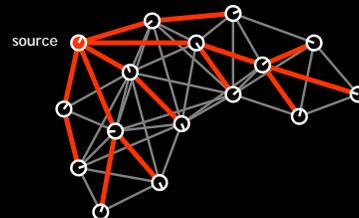

Broadcast Tree Path Distance

Purpose:

- To estimate the distance to the source of a message

Accuracy Metric:

- correlation coefficient between measured and actual distances

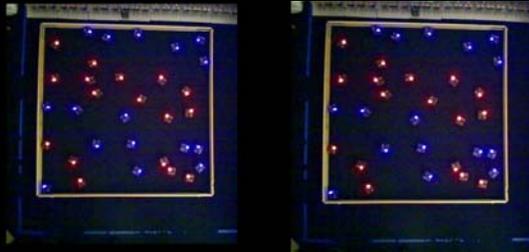

2008-01-06

CSE481C: Robotics Capstone, Lec2: Communications

12

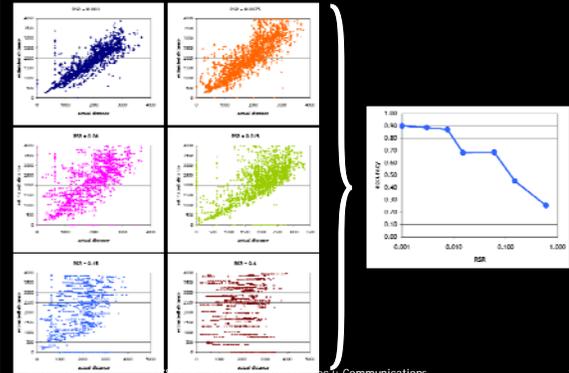

Dynamic Networks

Motion "smears" network and reduces the correspondence between network topology and physical positions

2008-01-06 CSE481C: Robotics Capstone, Lec2: Communications n = 33, $\tau = 0.250s$, speed = 0.08, RSR = 0.02

Broadcast Tree Path Distance

Distributed Algorithms in Communications Networks

What are you actually computing with a broadcast flood?
What kind of processing can you do by relaying messages to neighbors?

2008-01-06 CSE481C: Robotics Capstone, Lec2: Communications 17

Lab 2: Communications

Goal

- Build a layered control system to guide a robot towards light and away from obstacles
- Measure the robot's estimate of its *pose* from odometry compared to ground truth
